

Module 2 overview

lecture

1. Introduction to the module
2. Rational protein design
3. Fluorescence and sensors
4. Protein expression

SPRING BREAK

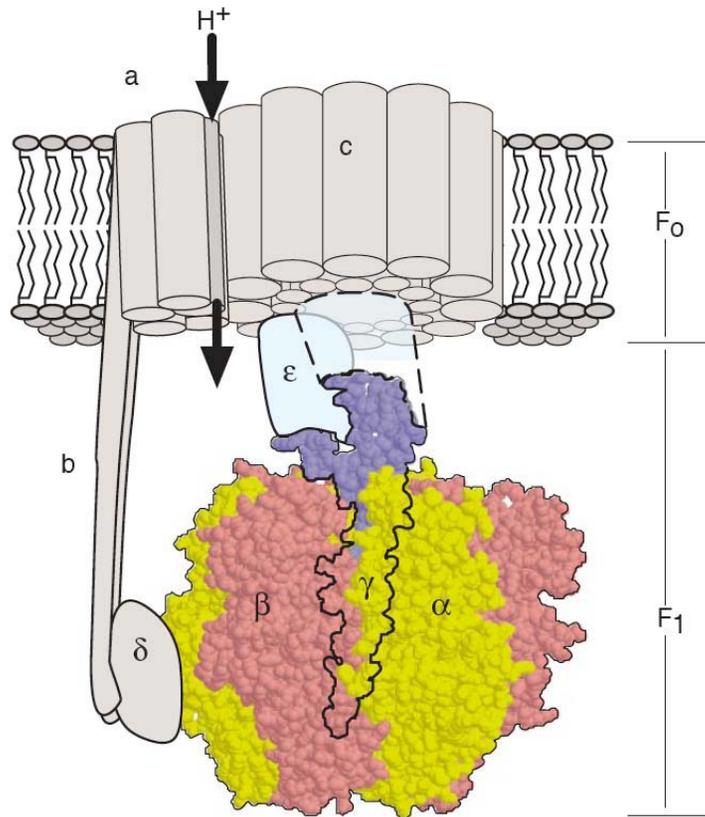

5. Review & gene analysis
6. Purification and protein analysis
7. Binding & affinity measurements
8. High throughput engineering

lab

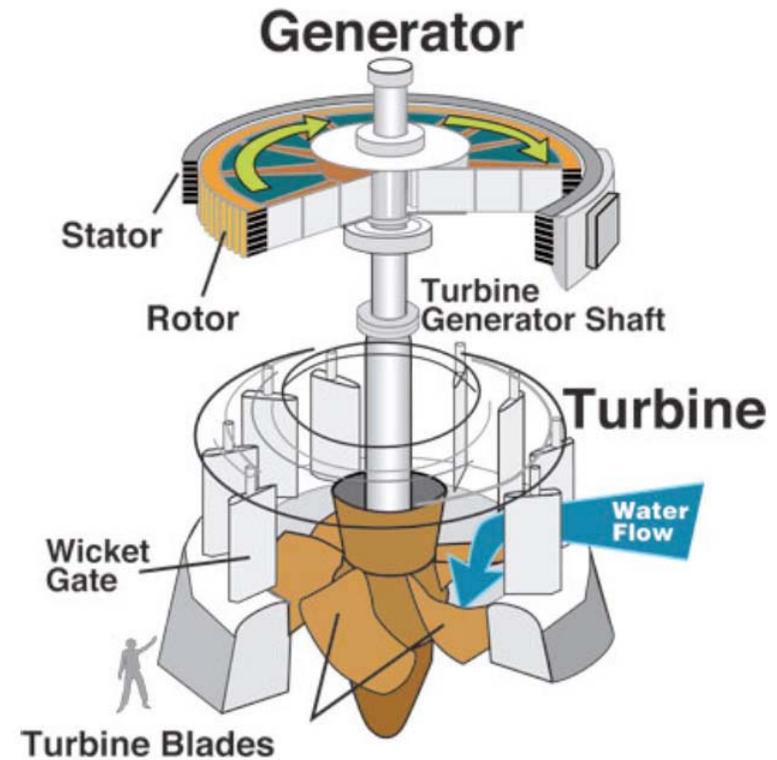

1. Start-up protein eng.
2. Site-directed mutagenesis
3. DNA amplification
4. Prepare expression system
5. Gene analysis & induction
6. Characterize expression
7. Assay protein behavior
8. Data analysis

Lecture 1: Introduction to the module

- I. Engineering proteins
- II. Pericam: an engineered protein sensor
 - A. Imaging calcium signaling
 - B. Calmodulin and GFP
 - C. Pericam variants
- III. Reengineering Pericam: experimental overview
 - A. Structure-based design
 - B. Protein expression and purification
 - C. Measurements and analysis

Calcium indicators can be used to detect signaling in individual cells and multicellular ensembles. Two purposes:

- learn what stimuli trigger calcium fluctuations and how calcium behaves in context of an organism or system
- use calcium as a “handle” on cell-cell interaction (*e.g.* neural activity)

Calcium is important to cellular signaling in the immune system. Activation of B-cells can be detected by calcium imaging in lymph nodes (Qi *et al.*, 2006, *Science*).

GFP = green fluorescent protein

CaM = calmodulin, a calcium-sensing protein

M13 is a CaM-binding fragment of a cellular kinase

Pericam is a second generation calcium sensor, based on design strategies originally developed by Roger Tsien and colleagues. Tsien won a 2008 Nobel Prize for engineering novel forms of GFP.

Calmodulin (CaM) facts and figures

- 16-18 kD (depending on species), $\sim 20 \times 40$ Å protein
- highly conserved among eukaryotes (vertebrate and yeast calmodulin are functionally interchangeable)
- binds four Ca^{2+} ions using EF hand amino acid sequence motifs
- Ca^{2+} -CaM binds short segments of target proteins, modulates activity

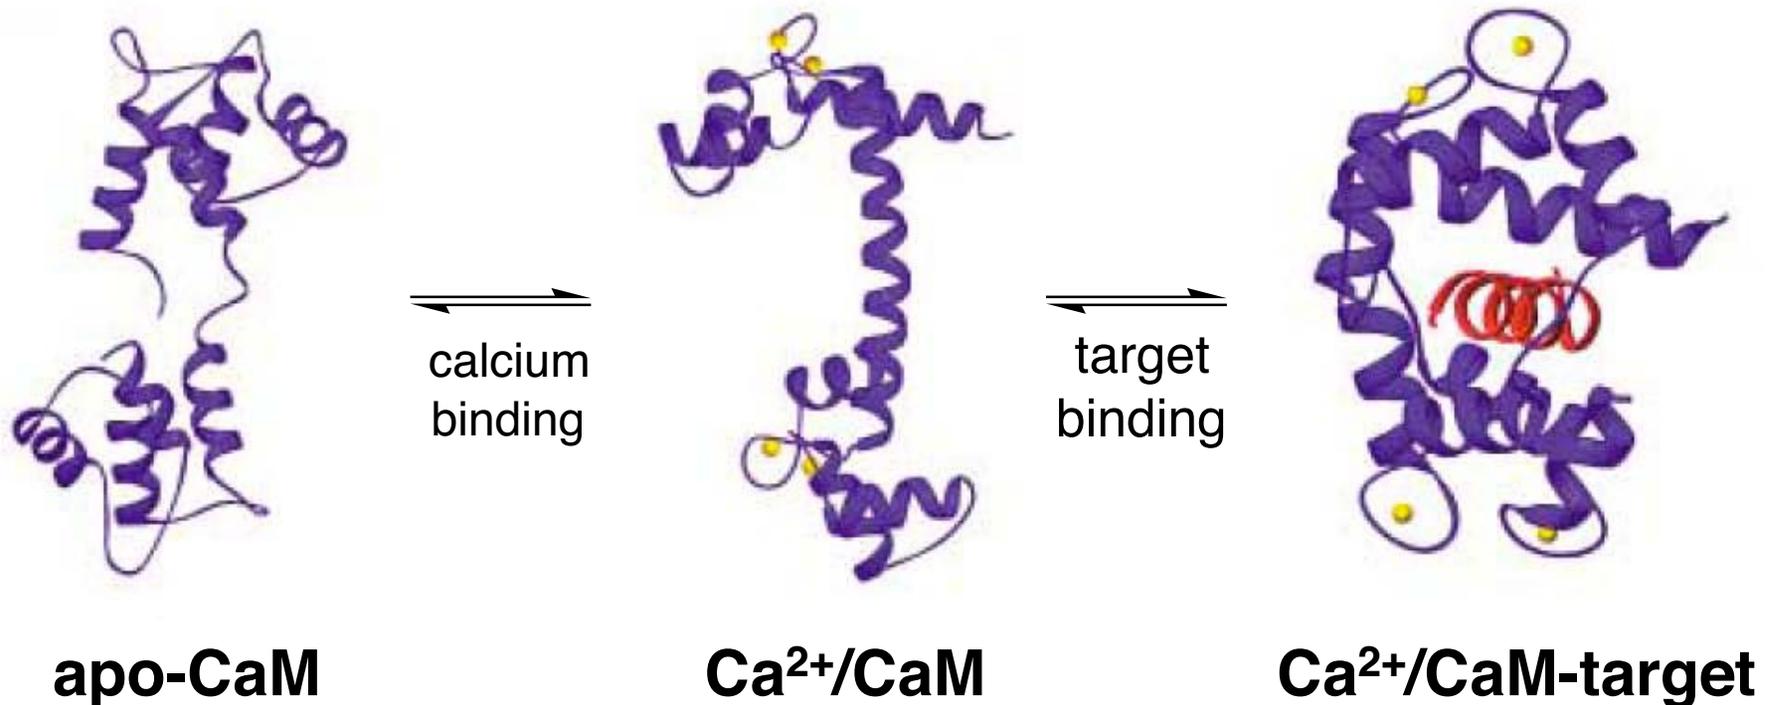

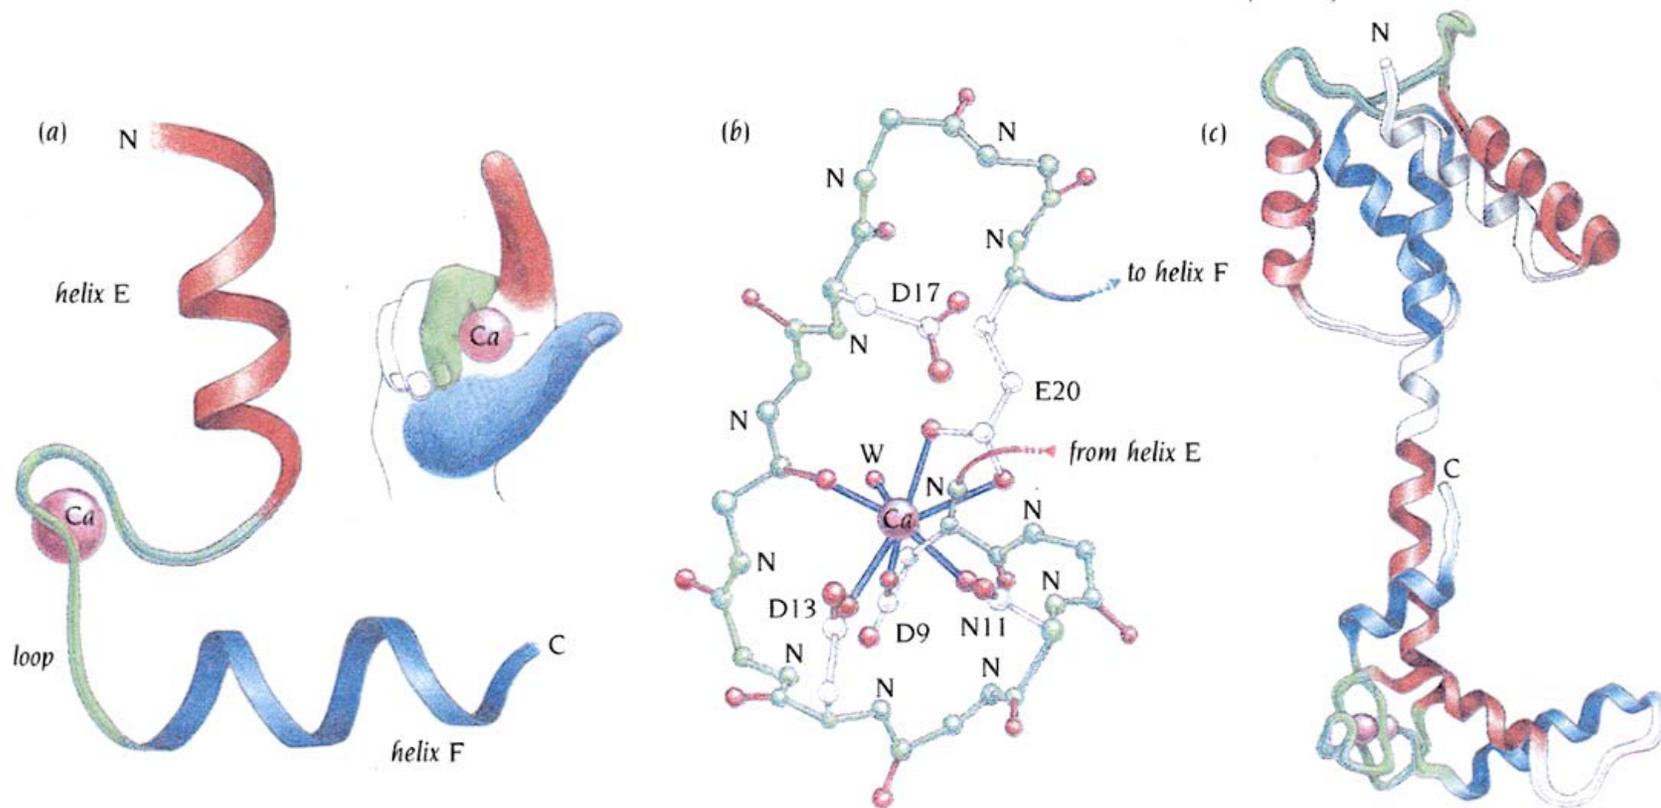

Image from Vetter, S. W., and E. Leclerc. "Novel Aspects of Calmodulin target Recognition and Activation." *Eur J Biochem* 270, no. 3 (2003): 404-414.

EF hand binding motif named for E & F helices of the calcium-binding protein parvalbumin; example of helix-loop-helix structure, with calcium bound in the loop

N- and C-terminal domains of CaM both contain two EF hand motifs

Green Fluorescent Protein (GFP)

from the jellyfish *Aequoria victoria* is a protein fluorophore and component of genetically-encoded calcium indicators. The molecular structure (1996) shows a chromophore formed by spontaneous cyclization and oxidation of three amino acids (Ser/Thr65, Tyr66, and Gly67).

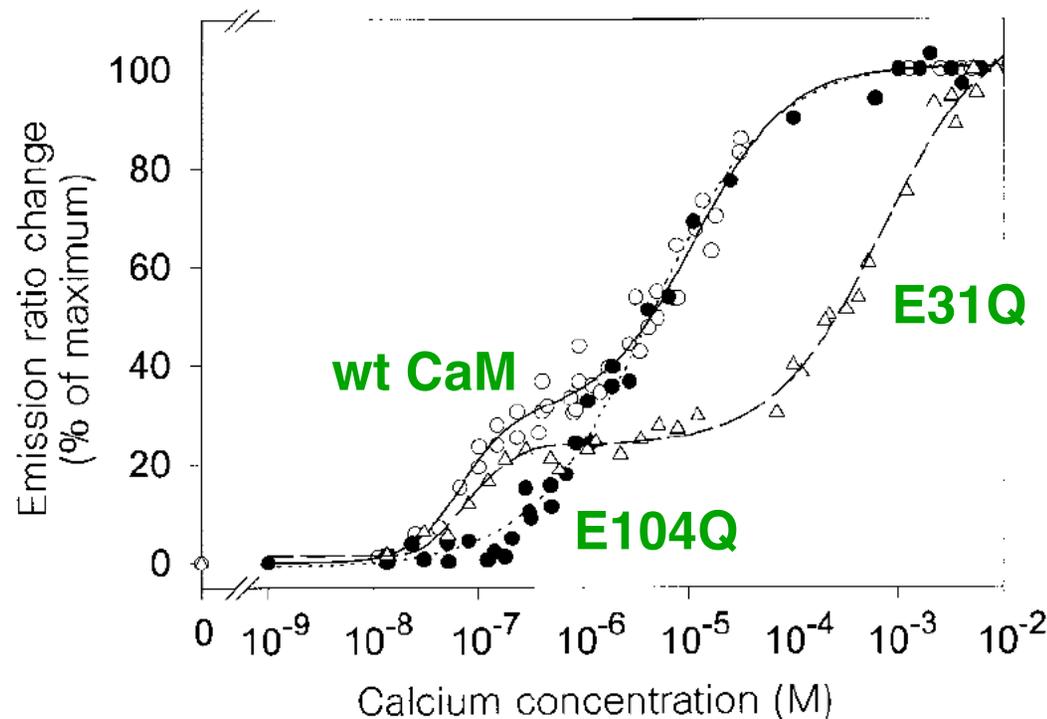

Images from Ormö, M., et al. "Crystal Structure of the *Aequorea victoria* Green Fluorescent Protein." *Science* 273, no. 5280 (Sept. 6, 1996): 1392-1395. DOI: 10.1126/science.273.5280.1392. © AAAS. Mutations can also affect calcium sensitivity; both K_d (affinity) and cooperativity (slope/shape of transition) can be affected. Miyawaki *et al.* engineered calcium sensitivity of CaMeleons, a related type of engineered protein calcium sensor:

In this module, our goal will be to influence the calcium sensitivity of “inverse pericam.”

Reprinted by permission from Macmillan Publishers Ltd: Nature. Source: Fig. 2B in Miyawaki, A., et al. "Fluorescent Indicators for Ca^{2+} Based on Green Fluorescent Proteins and Calmodulin." *Nature* 388, no. 6645 (1997): 834-5. © 1997.

Step 1: Design and implement mutations to affect inverse pericam's calcium sensitivity.

Skills:

- Use computational tool to look closely at protein structures
- Design primers to make site mutations in the pericam gene
- Perform mutagenesis using PCR

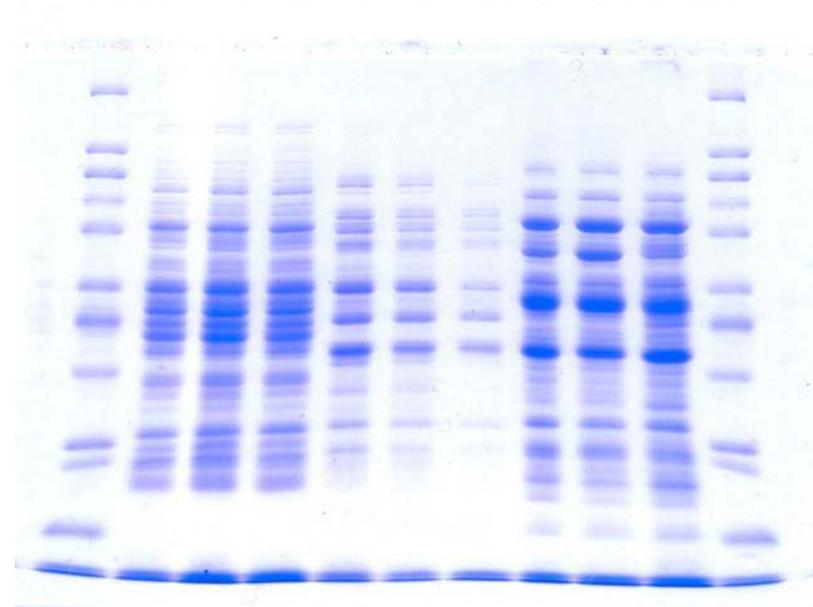

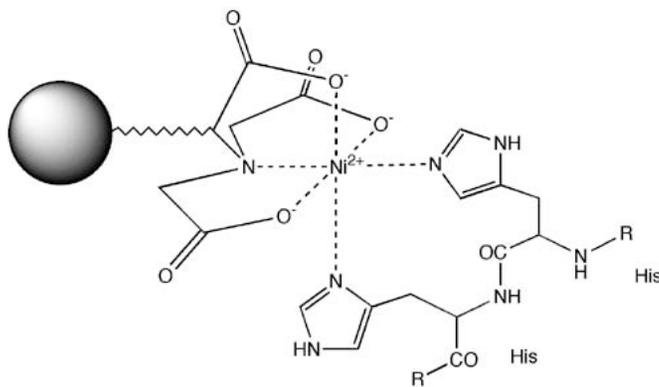

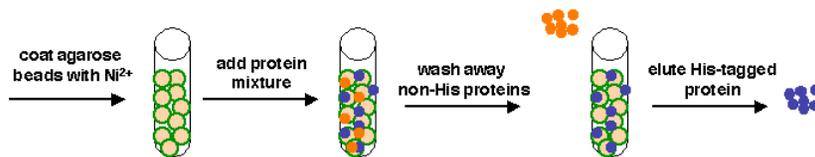

Courtesy of Agilent Technologies.
Used with permission.

Step 2: Express and purify mutant inverse pericams for analysis.

Skills:

- Transform plasmid DNA into *E. coli*
- Induce protein expression using IPTG
- Purify mutant pericams using affinity-based separation
- Assay protein expression and purity using SDS-PAGE

Step 3: Analyze calcium titration behavior of mutant pericams.

Skills:

- Perform fluorescence assays to measure calcium binding
- Use software to extract binding parameters from the data
- Pool data from across the class to observe patterns
