Lecture 1: Symmetry Elements and Operations

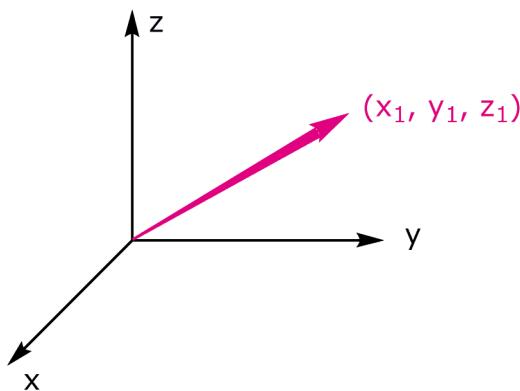

Consider the symmetry properties of an object (e.g. atoms of a molecule, set of orbitals, vibrations). The collection of objects is commonly referred to as a basis set

- classify objects of the basis set into *symmetry operations*
- *symmetry operations* form a *group*
- *group* mathematically defined and manipulated by *group theory*

A **symmetry operation** moves an object into an indistinguishable orientation

A **symmetry element** is a point, line or plane about which a symmetry operation is performed

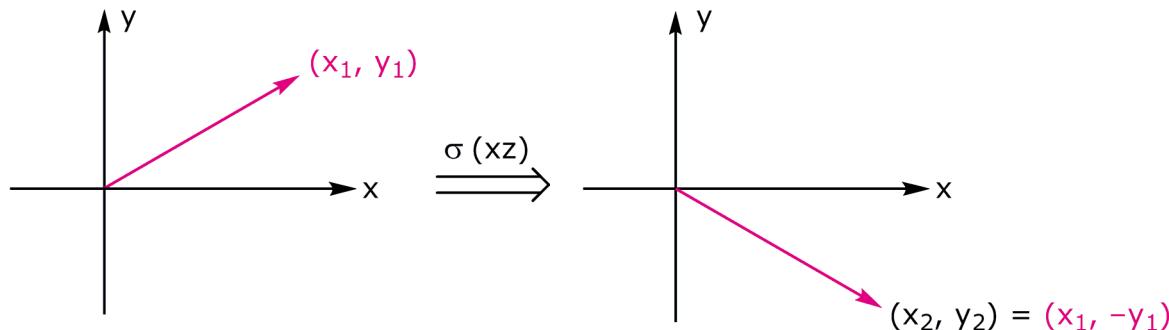

There are five symmetry elements, which will be defined relative to point with coordinate (x_1, y_1, z_1) :

1) **identity, E**

$$E(x_1, y_1, z_1) = (x_1, y_1, z_1)$$

2) **plane of reflection, σ**

$$\sigma(xz)(x_1, y_1, z_1) = (x_1, -y_1, z_1)$$

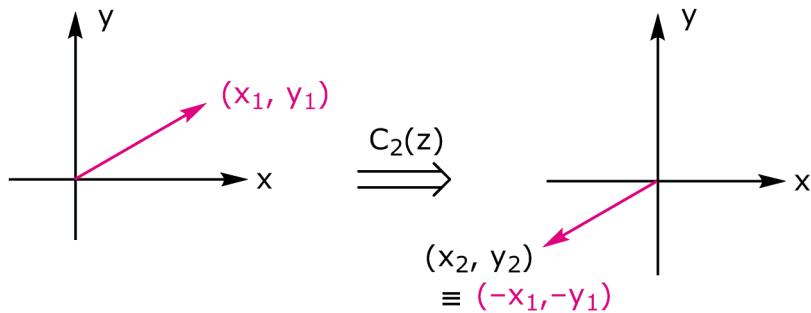

3) inversion, i

$$i(x_1, y_1, z_1) = (-x_1, -y_1, -z_1)$$

4) proper rotation axis, C_n (where $\theta = \frac{2\pi}{n}$)

convention is a clockwise rotation of the point

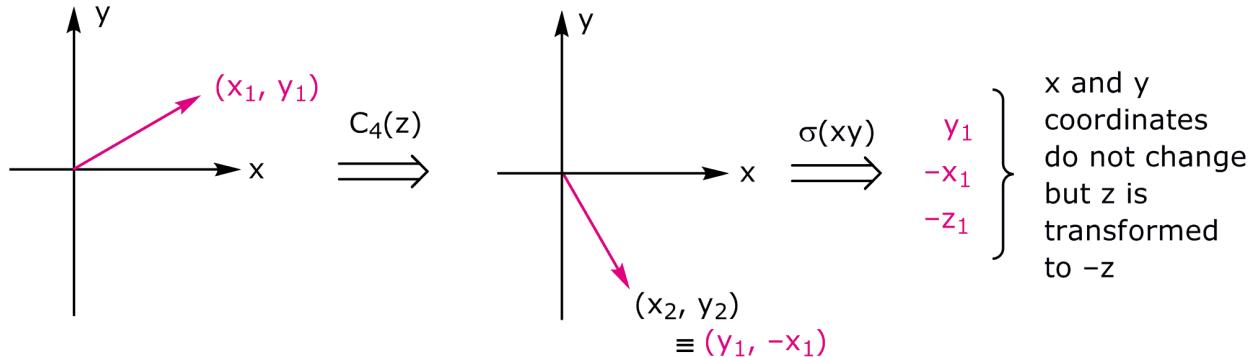

$$C_2(z)(x_1, y_1, z_1) = (-x_1, -y_1, z_1)$$

5) improper rotation axis, S_n

two step operation: C_n followed by σ through plane \perp to C_n

$$S_4(z)(x_1, y_1, z_1) = \sigma(xy) C_4(z)(x_1, y_1, z_1) = \sigma(xy)(y_1, -x_1, z_1) = (y_1, -x_1, -z_1)$$

Note: rotation of pt is clockwise; Corollary is that axes rotate counterclockwise relative to fixed point

In the example above, we took the **direct product** of two operators:

$$\sigma_h \cdot C_n = S_n$$

\downarrow
Horizontal mirror plane
(normal to C_n)

$$\text{for } n \text{ even : } S_n^n = C_n^n \cdot \sigma_h^n = E \cdot E = E$$

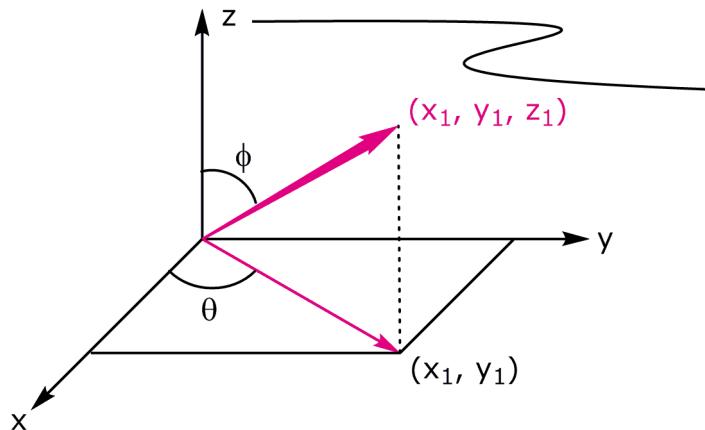

$$\text{for } n \text{ odd: } S_n^n = C_n^n \cdot \sigma_h^n = E \cdot \sigma_h = \sigma_h$$

$$S_n^{2n} = C_n^{2n} \cdot \sigma_h^{2n} = E \cdot E = \sigma_h$$

$$\text{for } m \text{ even: } S_n^m = C_n^m \cdot \sigma_h^m = C_n^m$$

$$\text{for } m \text{ odd: } S_n^m = C_n^m \cdot \sigma_h^m = C_n^m \cdot \sigma_h = S_n^m$$

Symmetry operations may be represented as matrices. Consider the vector \vec{v}

Convention is that the principal axis of rotation (rotation axis with highest n) positioned to be coincident with the z axis

$$1) \text{ identity: } E \begin{bmatrix} x_1 \\ y_1 \\ z_1 \end{bmatrix} = \begin{bmatrix} ? & & ? \end{bmatrix} \begin{bmatrix} x_1 \\ y_1 \\ z_1 \end{bmatrix} = \begin{bmatrix} x_1 \\ y_1 \\ z_1 \end{bmatrix}$$

matrix satisfying this condition is: $\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$

$$\therefore E = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \dots E \text{ is always the unit matrix}$$

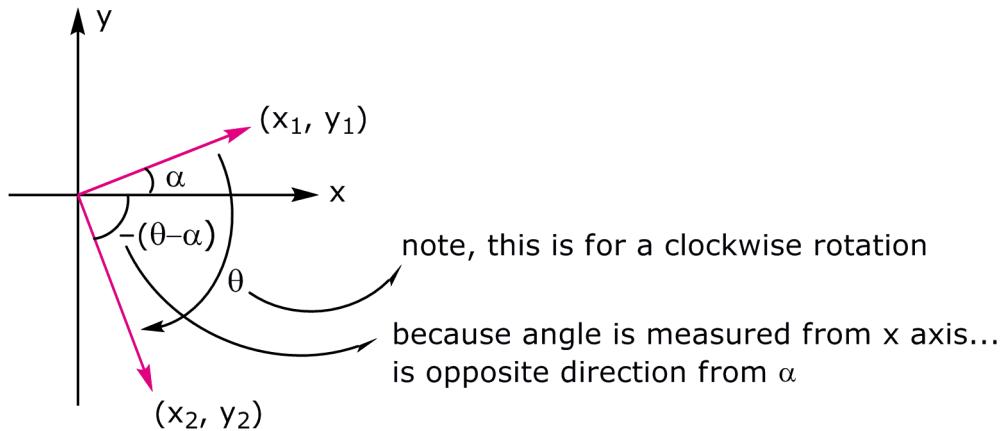

$$2) \text{ reflection: } \sigma(xy) \begin{bmatrix} x_1 \\ y_1 \\ z_1 \end{bmatrix} = \begin{bmatrix} x_1 \\ y_1 \\ -z_1 \end{bmatrix} \quad \therefore \sigma(xy) = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & -1 \end{bmatrix}$$

$$\text{similarly } \sigma(xz) = \begin{bmatrix} 1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \quad \text{and} \quad \sigma(yz) = \begin{bmatrix} -1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$3) \text{ inversion: } i \begin{bmatrix} x_1 \\ y_1 \\ z_1 \end{bmatrix} = \begin{bmatrix} -x_1 \\ -y_1 \\ -z_1 \end{bmatrix} \quad \therefore i = \begin{bmatrix} -1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & -1 \end{bmatrix}$$

4) proper rotation axis:

because of convention, ϕ , and hence z_i , is not transformed under $C_n(\theta)$ \therefore
projection into xy plane need only be considered... i.e., rotation of vector $v(x_i, y_i)$ through θ

$$\begin{aligned} x_1 &= \bar{v} \cos \alpha & \xrightarrow{C_n(\theta)} & x_2 = \bar{v} \cos [-(\theta - \alpha)] = \bar{v} \cos (\theta - \alpha) \\ y_1 &= \bar{v} \sin \alpha & & y_2 = \bar{v} \sin [-(\theta - \alpha)] = -\bar{v} \sin (\theta - \alpha) \end{aligned}$$

using identity relations:

$$\begin{aligned} x_2 &= \bar{v} \cos (\theta - \alpha) = \bar{v} \cos \theta \cos \alpha + \bar{v} \sin \theta \sin \alpha = x_1 \cos \theta + y_1 \sin \theta \\ y_2 &= -\bar{v} \sin (\theta - \alpha) = -[\bar{v} \sin \theta \cos \alpha - \bar{v} \cos \theta \sin \alpha] = -x_1 \sin \theta + y_1 \cos \theta \end{aligned}$$

Reformulating in terms of matrix representation:

$$C_n(\theta) \begin{bmatrix} x_1 \\ y_1 \\ z_1 \end{bmatrix} = \begin{bmatrix} x_1 \cos \theta + y_1 \sin \theta \\ -x_1 \sin \theta + y_1 \cos \theta \\ z_1 \end{bmatrix}$$

$$\therefore C_n(\theta) = \begin{bmatrix} \cos \theta & \sin \theta & 0 \\ -\sin \theta & \cos \theta & 0 \\ 0 & 0 & 1 \end{bmatrix} \quad \text{where } \theta = \frac{2\pi}{n}$$

Note... the rotation above is clockwise, as discussed by HB (pg 39). Cotton on pg. 73 solves for the counterclockwise rotation... and presents the clockwise result derived above. To be consistent with HB (and math classes) we will rotate *clockwise* as the convention.

The above matrix representation is completely general for any rotation θ ...

Example: $C_3, \theta = \frac{2\pi}{n}$

$$C_3 = \begin{bmatrix} \cos \frac{2\pi}{3} & \sin \frac{2\pi}{3} & 0 \\ -\sin \frac{2\pi}{3} & \cos \frac{2\pi}{3} & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} -\frac{1}{2} & \frac{\sqrt{3}}{2} & 0 \\ -\frac{\sqrt{3}}{2} & -\frac{1}{2} & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

5) improper rotation axis :

$$\sigma_h \cdot C_n(\theta) = S_n(\theta)$$

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & -1 \end{bmatrix} \cdot \begin{bmatrix} \cos \theta & \sin \theta & 0 \\ -\sin \theta & \cos \theta & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} \cos \theta & \sin \theta & 0 \\ -\sin \theta & \cos \theta & 0 \\ 0 & 0 & -1 \end{bmatrix}$$

Like operators themselves, matrix operations may be manipulated with simple matrix algebra...above direct product yields matrix representation for S_n .

Another example:

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & -1 \end{bmatrix} \cdot \begin{bmatrix} -1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} -1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & -1 \end{bmatrix}$$

$$\sigma_{xy} (= \sigma_h) \cdot C_2(z) = i$$
