

# Analysis of Variation Sources in Ring Oscillator Layouts

Thomas Chandler and Shion Hung  
*Non-Members, IEEE*

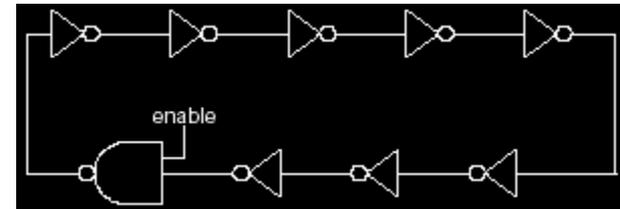

# Agenda

- Acknowledgment of Original work
- Methods
- Areas for Exploration
  - Polysilicon Density Effects
  - Single chips vs. 'superchip'
  - Two way effects
- Results
- Conclusions

# Acknowledgement of Original Work

- Based on Karen M. Gonzalez-Valentin's Master thesis: "Extraction of Variation Sources due to Layout Practices"
- Multiple ring oscillator structures on 35 chips
- Conclusions:
  - Poly Density changes frequency by 2.5%
  - Finger spacing has significant effect
  - Vertical ring oscillators also significant

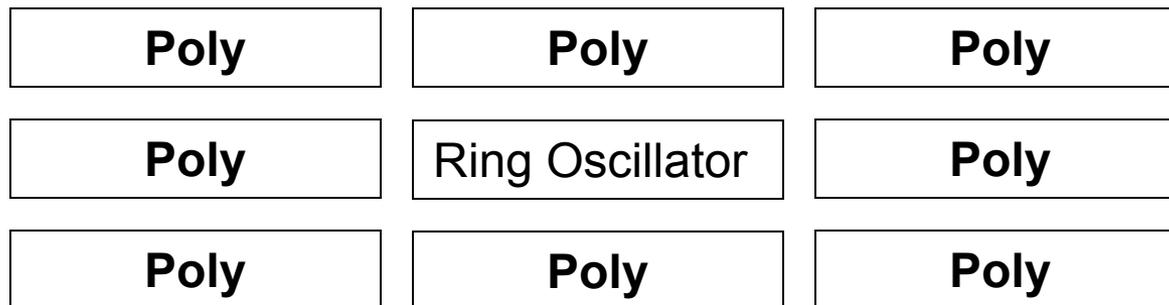

# Methods

- Compiled data for aggregate ‘superchip’
- Used JMP-IN
  - Fit model for polysilicon density
  - Two way interactions – least squares regression
- Compared whether individual results within ‘superchip’ confidence interval

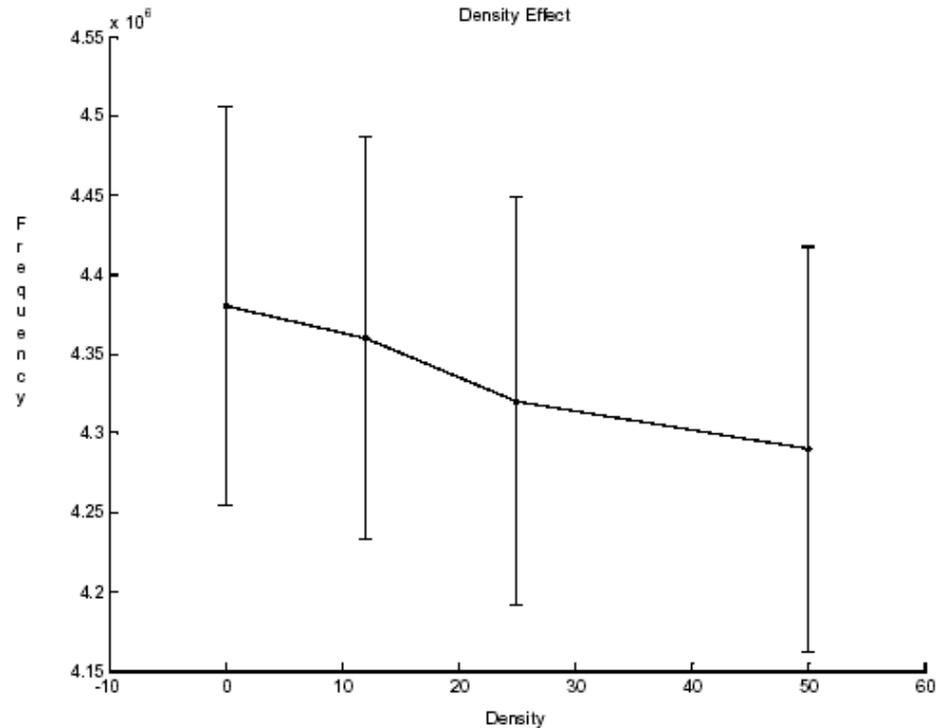

# Areas for Exploration – Poly Density Effects

- Determine a model for the effect of polysilicon density on frequency

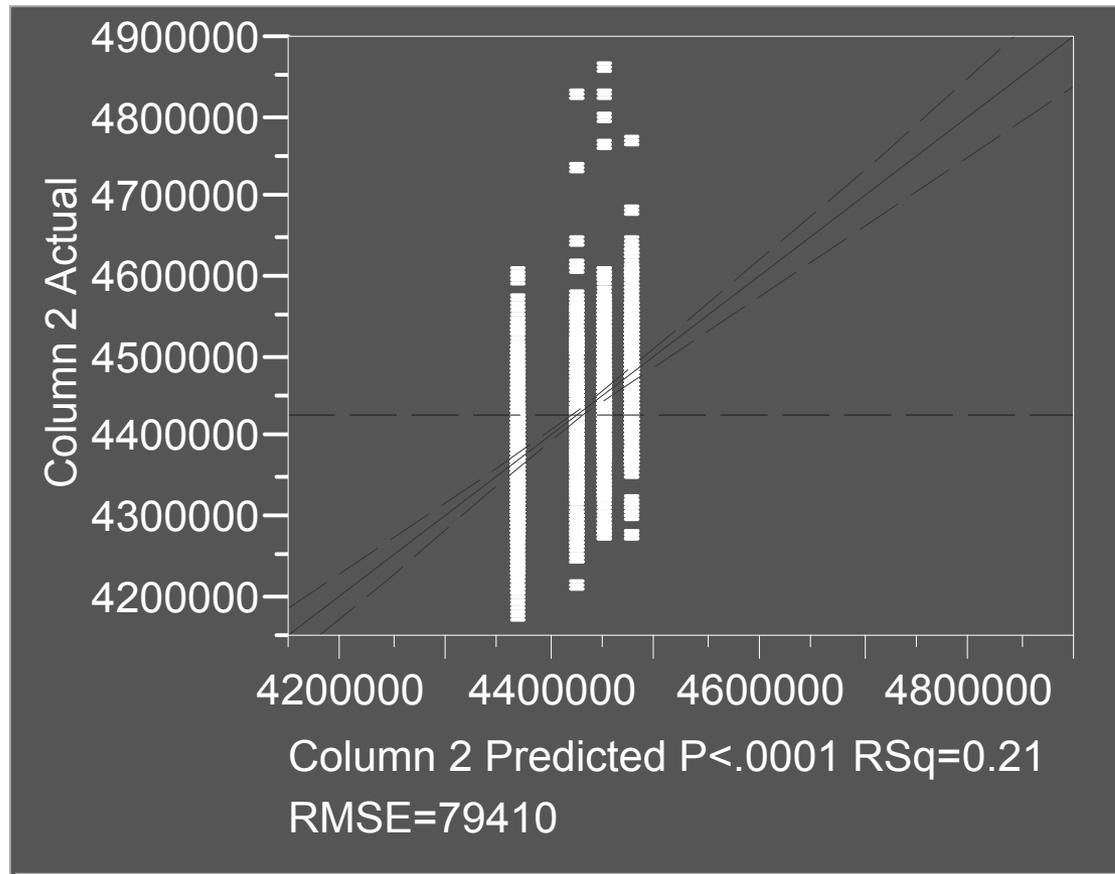

- Based on measurements for poly density = 0%, 12.5%, 25%, 50%

# Fit Model for Poly Density

$$frequency = 4.477 - 0.213 * density$$

# Actual by Predicted Poly Density

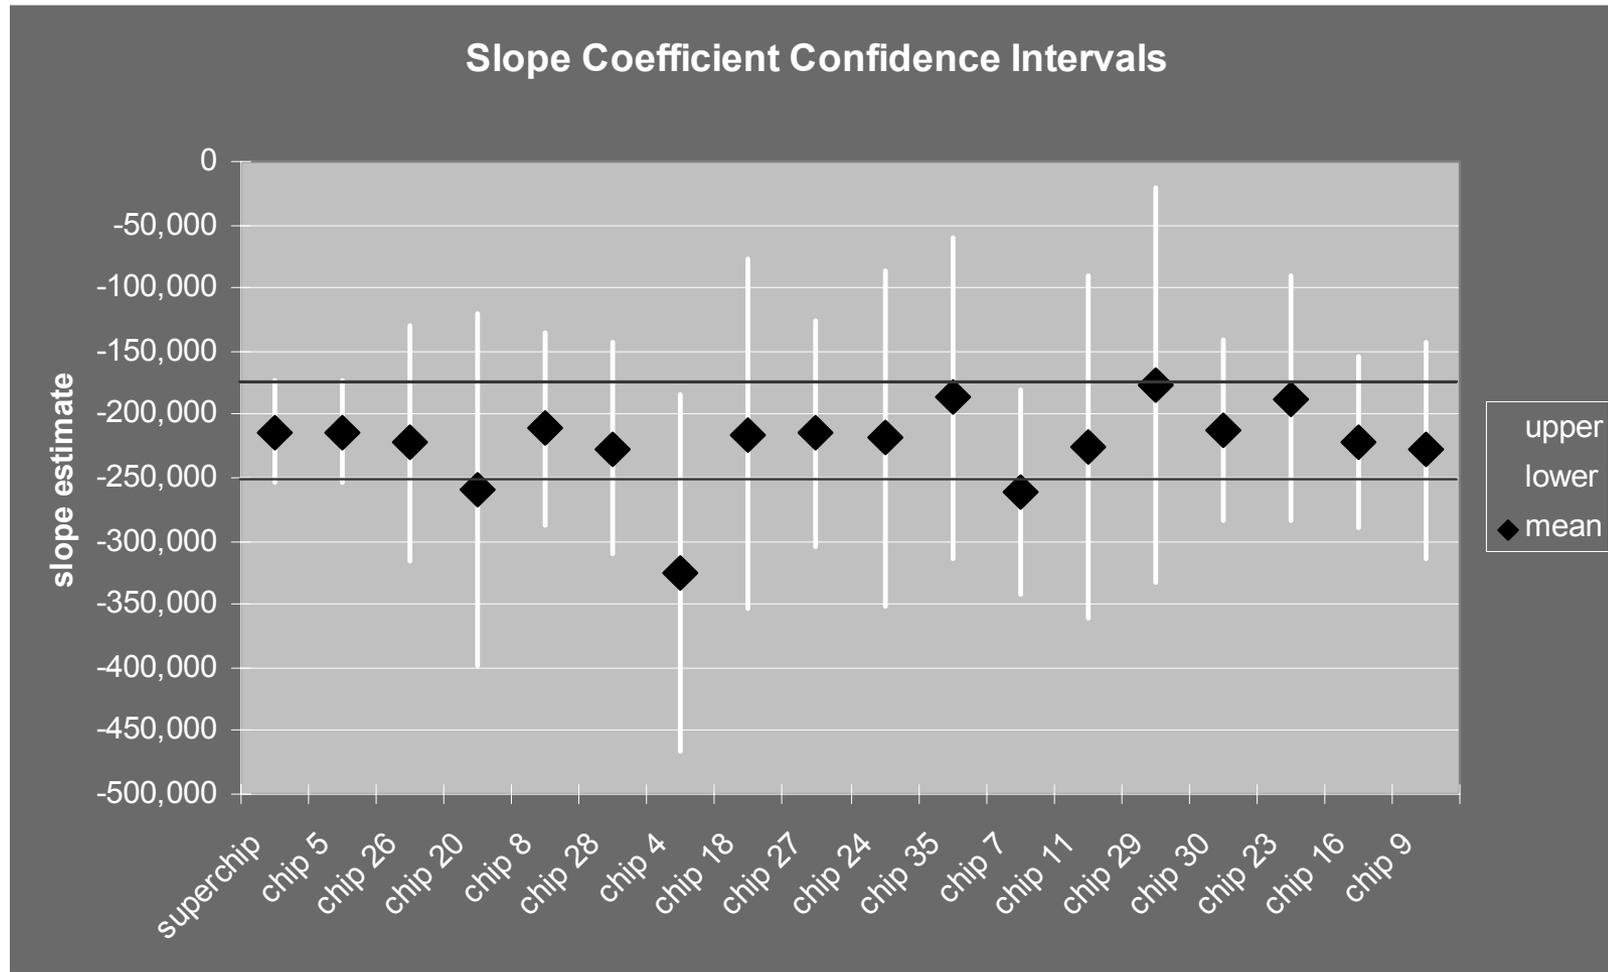

# Single chips vs. 'superchip'

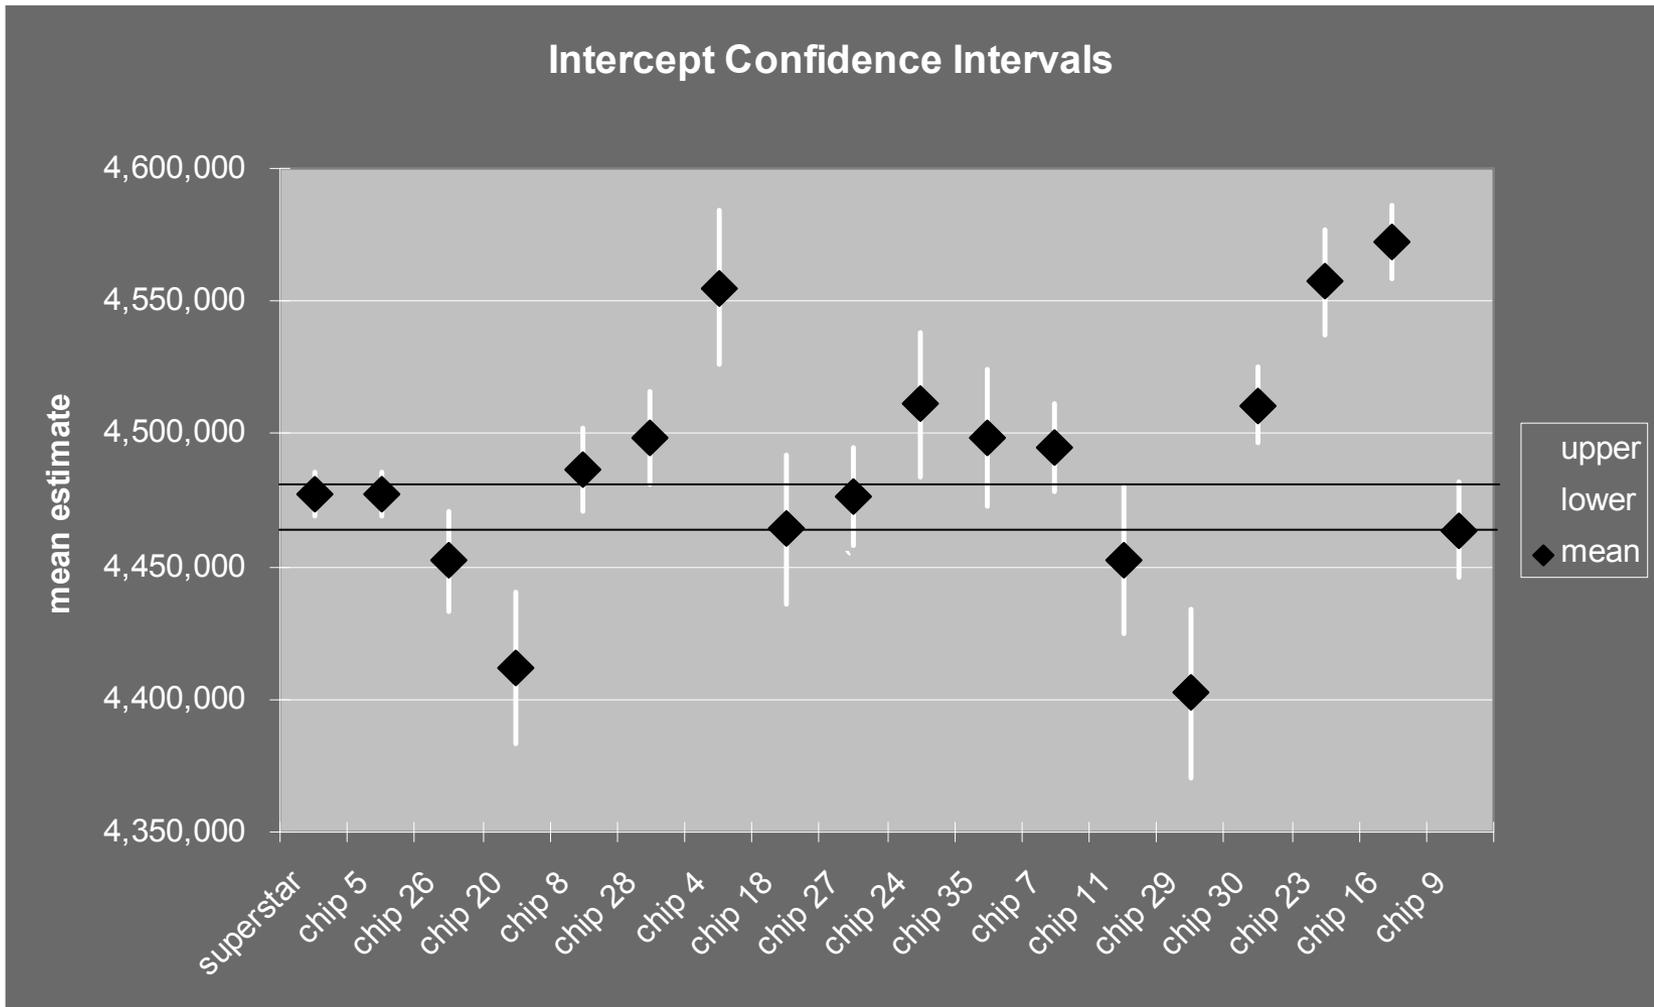

- Any differences between individual chip behavior and the aggregate 'superchip'?

# Results – Poly Density

# Intercept Confidence Intervals

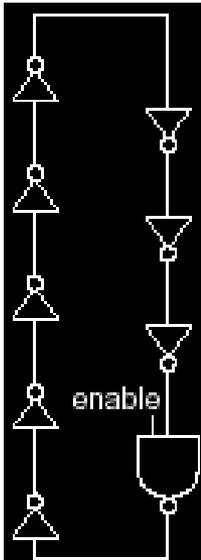

# Areas for Exploration - Two way effects with Vertical RO's

● Gonzalez-Valentin's demonstrated that Vertical RO's may be different (lower  $\mu$ , larger  $\sigma$ )

- May be due to mask making bias or ion implantation effect

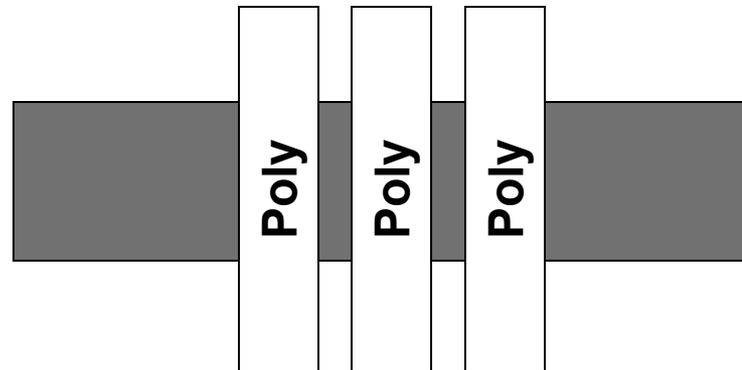

● Next question:

- Are these vertical effects truly significant?
- Are there any effect interactions in the data set?

# Vertical RO's versus 3x spacing

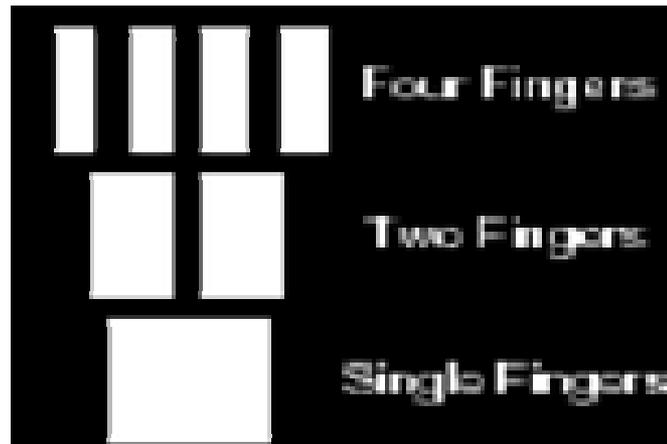

- Does line spacing have a significant effect on frequency?

- Significant interaction with Vertical RO's?

# Vertical RO's vs Single Finger

- Canonical RO has multiple fingers
  - Does a single finger with same effective gate length have a different effect?

- Significant interaction with Vertical RO's?

# Two way interactions

## Vertical vs. 3x spacing

- Both main effects are significant ( $<0.001$ )
- Cross term not significant

## Vertical vs. single finger

- Both main effects are significant ( $<0.001$ )
- Cross term is significant ( $<0.001$ ), but magnitude is minimal

## Summary of Fit

RSquare	0.442632
RSquare Adj	0.442533
Root Mean Square Error	121798.8
Mean of Response	4411380
Observations (or Sum Wgts)	17010

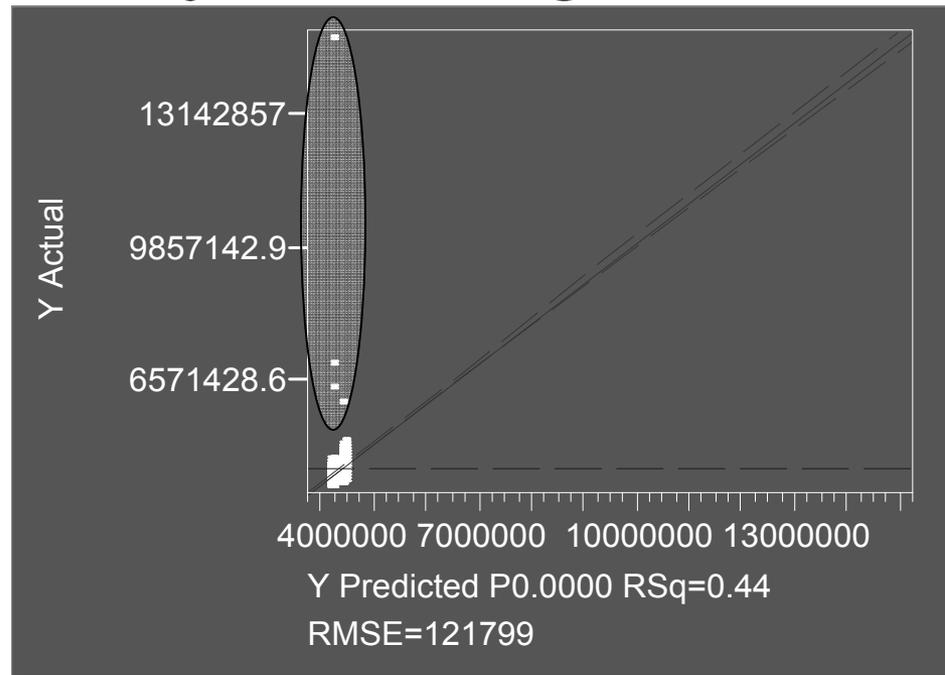

Avg. RSquare for individual chips:  
**0.887206**

## Parameter Estimates

Term	Estimate	Std Error	t Ratio	Prob> t
Intercept	4363792.7	1153.876	3781.9	0.0000
vertical	-22979.12	1153.876	-19.91	<.0001
single finger	-110366.5	1153.876	-95.65	0.0000
vertical*single finger	7898.9525	1153.876	6.85	<.0001

# Fit of 'superchip' poor

- 'Superchip'  $R^2$  values were much worse than the individual chips
- Fit affected by some significant outliers:

# Conclusions

- All main effects inspected in paper were significant
- Model fit for polysilicon density effect
  - 50%  $\Delta$  in density = 3%  $\Delta$  in frequency
  - Density has a consistent effect over multiple individual chips
- Significant but small interaction between vertical RO's and single finger

# Questions?
