

Assignment 6: The *azba* language

Due: Oct. 28

This week's assignment is a short one: (see lecture notes for the reading assignment)

- Read through the LFCD.pl implementation of Hayes' proposal (in this week's perlscripts directory). Make sure you understand how it implements the LFCD approach (if something doesn't look clear, ask—it could be a bug)
- Prince & Tesar (1999) discuss the problematic *azba* language (section 6). Prepare an input file of tableaux demonstrating the *azba* language, that can be run in RCD.pl and LFCD.pl. Hayes (1999) claims that the LFCD works on the *azba* language. Does it? How?
