Total	100	: N

1. (20pts) For what values of λ , μ and ν does the function $f: \mathbb{R}^3 \longrightarrow \mathbb{R}$, $f(x,y,z) = \lambda x^2 + \mu xy + y^2 + \nu z^2,$

have a non-degenerate local minimum at (0,0,0)?

$$Df = (2) \times + \mu y, 2y + \mu x, 2vz$$

$$Hf = \begin{pmatrix} 2 \times \mu & 0 \\ \mu & 2 & 0 \\ 0 & 0 & 2 \end{pmatrix}$$

$$d_1 = 2\lambda, \quad d_2 = 4\lambda - \mu, \quad d_3 = 2v. d_2.$$

2. (20pts) Let
$$f: \mathbb{R}^3 \longrightarrow \mathbb{R}$$
 be the function $f(x, y, z) = 2x + y - z$

(i) Show that f has a global minimum on the ellipsoid
$$x^2 + 2y^2 + 3z^2 = 6$$
.

$$K = \sum (x_1 y_1 z_2) \in \mathbb{R}^3 | x^2 + 2y^2 + 3z^2 = 63$$

is dozed + bounded. So K is compact.
 f is cts, K is compact => f has a global minimum.

(ii) Find this minimum.

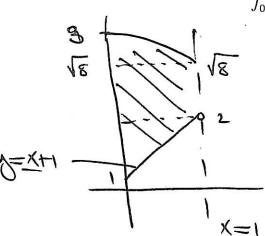

Consider
$$R: \mathbb{R}^4 \to \mathbb{R}$$
 given by

 $k(x) y_1 z_2 x_1 = 2x + y_1 - z = x(x^{\frac{1}{2}} 2y_1^2 + 3z_2^{-\frac{1}{2}})$

Critical pts of $R: X = \frac{1}{2}$
 $x = 4y = -6z$
 $4y = \frac{1}{2}$
 $x = 4y = -6z$
 $-6z = \frac{1}{2}$
 $x = 4y = -6z$
 $-6z = \frac{1}{2}$
 $x = 4y = -6z$
 $x = 4$

- 3. (20pts)
- (i) Draw a picture of the region of integration of

(ii) Change the order of integration of the integral.

$$\int_{1}^{2} \int_{8}^{8} dx dy + \int_{8}^{8} \int_{8}^{1}$$

4. (20pts) Let W be the region inside the two cylinders $x^2 + y^2 = 1$ and $y^2 + z^2 = 1$.

Set up an integral to calculate the volume of W and calculate this integral.

View as a region of type 2.

$$vol(w) = \iiint dx dy dz$$

$$= \int_{-1}^{1} \left(\int_{-1/2}^{1-y^2} dx \right) dz dy$$

$$= 2 \int_{-1/2}^{1} \int_{-1/2}^{1-y^2} dz dy$$

$$= 4 \le \left[y - \frac{y^2}{3} \right]_{-1/2}^{1}$$

$$= 8 \left(1 - \frac{1}{3} \right) = \frac{16}{3}.$$

- 5. (20pts) Let D be the region in the first quadrant bounded by the curves $y^2 = x$, $y^2 = 2x$, xy = 1 and xy = 4.
- (i) Find du dv in terms of dx dy, where $u = \frac{y^2}{x}$ and v = xy.

$$\frac{\partial(x,y)}{\partial(x,y)} = \begin{vmatrix} -x^{2} & -2y^{2} & -3y^{2} \\ -x & x \end{vmatrix} = -y^{2} - 2y^{2} = -3y^{2}$$

$$\frac{\partial(x,y)}{\partial(x,y)} = -x$$

$$\frac{\partial(x,y)}{\partial(x,y)} = \frac{-x}{3y^{2}} \qquad dx dy = (3y)^{2} dy dy$$

(ii) Set up an integral to calculate the area of the region D and calculate this integral.

$$\iint_{D} dx dy = \iint_{3}^{2} \frac{du}{3u} dv$$

$$= \iint_{3}^{4} \left[\ln u \right]^{2} dv$$

$$= \ln 2$$

$$= \ln 2$$
