

PS5: HTM-Kinematic coupling exercise

What to do

□ Compliance error analysis (list assumptions)

□ Kinematic coupling exists between A & B

R_{ball}	= 1 inch	$R_{\text{groove1}}=R_{\text{groove2}}$	= flat
R_{coupling}	= 12 inch	E_{ball}	= 30×10^6 psi
$\nu_{\text{ball}} = \nu_{\text{ball}}$	= 0.3	θ_{inc}	= 90 degrees
Preload	= 500 lbf		

□ Ignore part 3 & 4 in your analysis

1. $\delta D|_A$: Parametric in terms of
 $F, L_i, I_i, J_i, G_i, E_i, k_{\text{coupling}}$

2. What percent of error is due to
kinematic coupling compliance vs frame compliance?

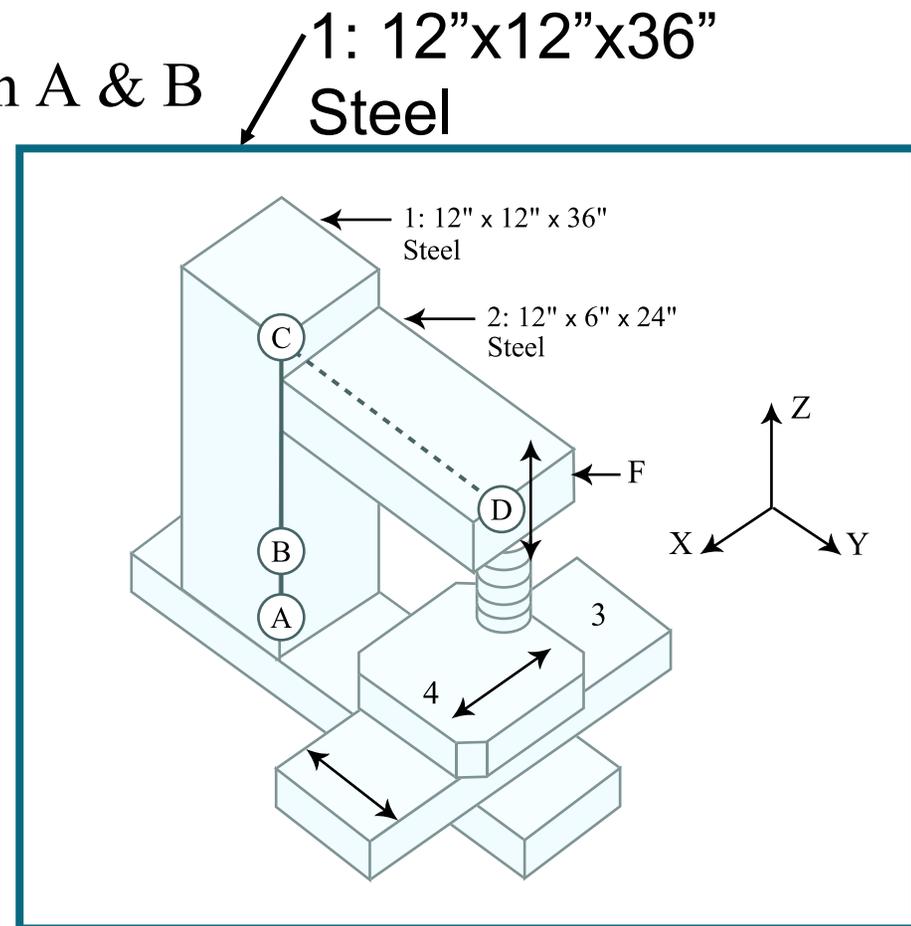

Figure by MIT OCW.
