PROBLEM 12.1Part a

Since we are in the steady state ( $\partial/\partial t = 0$ ), the total forces on the piston must sum to zero. Thus

$$pLD + (f^e)_x = 0 \quad (a)$$

where  $(f^e)_x$  is the upwards vertical component of the electric force

$$(f^e)_x = - \frac{\epsilon_0 V_0^2}{2x^2} LD \quad (b)$$

Solving for the pressure  $p$ , we obtain

$$p = \frac{\epsilon_0 V_0^2}{2x} \quad (c)$$

Part b

Because  $\frac{d}{L} \ll 1$ , we approximate the velocity of the piston to be negligibly small. Then, applying Bernoulli's equation, Eq. (12.2.11) right below the piston and at the exit nozzle where the pressure is zero, we obtain

$$\frac{1}{2} \rho V_p^2 = \frac{\epsilon_0 V_0^2}{2x^2} \quad (d)$$

Solving for  $V_p$ , we have

$$V_p = \frac{V_0}{x} \sqrt{\frac{\epsilon_0}{\rho}} \quad (e)$$

Part c

The thrust  $T$  on the rocket is then

$$\begin{aligned} T &= V_p \frac{dM}{dt} = V_p^2 \rho dD \quad (f) \\ &= \frac{\epsilon_0 V_0^2}{x^2} dD \end{aligned}$$

PROBLEM 12.2Part a

The forces on the movable piston must sum to zero. Thus

$$pwD - f^e = 0 \quad (a)$$

where  $f^e$  is the component of electrical force normal to the piston in the direction of  $V$ , and  $p$  is the pressure just to the right of the piston.

$$f^e = \frac{\mu_0 I^2 D}{2w} \quad (b)$$

ELECTROMECHANICS OF INCOMPRESSIBLE, INVISCID FLUIDS

PROBLEM 12.2 (Continued)

Therefore

$$p = \frac{\mu_0 I^2}{2w^2} \quad (c)$$

Assuming that the velocity of the piston is negligible, we use Bernoulli's law, Eq. (12.2.11), just to the right of the piston and at the exit orifice where the pressure is zero, to write

$$\frac{1}{2} \rho V^2 = p \quad (d)$$

or

$$V = \frac{I}{w} \sqrt{\frac{\mu_0}{\rho}} \quad (e)$$

Part b

The thrust T is

$$T = V \frac{dM}{dt} = V^2 \rho dW = \frac{\mu_0 I^2 d}{w} \quad (f)$$

Part c

For  $I = 10^3 \text{ A}$

$d = .1 \text{ m}$

$w = 1 \text{ m}$

$\rho = 10^3 \text{ kg/m}^3$

the exit velocity is

$$V = 3.5 \times 10^{-2} \text{ m/sec.}$$

and the thrust is

$$T = .126 \text{ newtons.}$$

Within the assumption that the fluid is incompressible, we would prefer a dense material, for although the thrust is independent of the fluid's density, the exhaust velocity would decrease with increasing density, and thus the rocket will work longer. Under these conditions, we would prefer water in our rocket, since it is much more dense than air.

PROBLEM 12.3

Part a

From the results of problem 12.2, we have that the pressure p, acting just to the left of the piston, is

$$p = \frac{\mu_0 I^2}{2w^2} \quad (a)$$

The exit velocity at each orifice is obtained by using Bernoulli's law just to the left of the piston and at either orifice, from which we obtain

PROBLEM 12.3 (Continued)

$$V = \left( \frac{\mu_0}{\rho} \right)^{1/2} \frac{I}{w} \quad (b)$$

at each orifice.

Part b

The thrust is

$$T = 2V \frac{dM}{dt} = 2V^2 \rho dw \quad (c)$$

$$T = \frac{2\mu_0 I^2 d}{w} \quad (d)$$

PROBLEM 12.4Part a

In the steady state, we choose to integrate the momentum theorem, Eq. (12.1.29), around a rectangular surface, enclosing the system from  $-L \leq x_1 \leq +L$ .

$$-\rho V_0^2 a + \rho [V(L)]^2 b = P_0 a - P(L)b + F \quad (a)$$

where  $F$  is the  $x_1$  component force per unit length which the walls exert on the fluid. We see that there is no  $x_1$  component of force from the upper wall, therefore  $F$  is the force purely from the lower wall.

In the steady state, conservation of mass, (Eq. 12.1.8), yields

$$V(L) = V_0 \frac{a}{b} \bar{i}_1 \quad (b)$$

Bernoulli's equation gives us

$$\frac{1}{2} \rho V_0^2 + P_0 = \frac{1}{2} \rho V_0^2 \frac{a^2}{b^2} + P(L) \quad (c)$$

Solving (c) for  $P(L)$ , and then substituting this result and that of (b) into (a), we finally obtain

$$F = P_0(b-a) + \rho V_0^2 \left( -a + \frac{b}{2} + \frac{a^2}{2b} \right) \quad (d)$$

The problem asked for the force on the lower wall, which is just the negative of  $F$ .

Thus

$$F_{\text{wall}} = -P_0(b-a) - \rho V_0^2 \left( -a + \frac{a^2}{2b} + \frac{b}{2} \right) \quad (e)$$

PROBLEM 12.5Part a

We recognize this problem to be analogous to a dielectric or high-permeability cylinder placed in a uniform electric or magnetic field. The solutions are then dipole fields. We expect similar results here. As in Eqs. (12.2.1 - 12.2.3), we

PROBLEM 12.5 (continued)

define

$$\bar{v} = -\nabla\phi$$

and since

$$\nabla \cdot \bar{v} = 0$$

then  $\nabla^2\phi = 0$ .

Using our experience from the electromagnetic field problems, we guess a solution of the form

$$\phi = \frac{A}{r} \cos \theta + Br \cos \theta$$

Then

$$\bar{v} = \left(\frac{A}{r^2} \cos \theta - B \cos \theta\right) \bar{i}_r + \left(\frac{A}{r^2} \sin \theta + B \sin \theta\right) \bar{i}_\theta$$

Now, as  $r \rightarrow \infty$

$$v = v_0 \bar{i}_1 = v_0 (\cos \theta \bar{i}_r - \bar{i}_\theta \sin \theta)$$

Therefore

$$B = -v_0$$

The other boundary condition at  $r = a$  is that

$$v_r(r=a) = 0$$

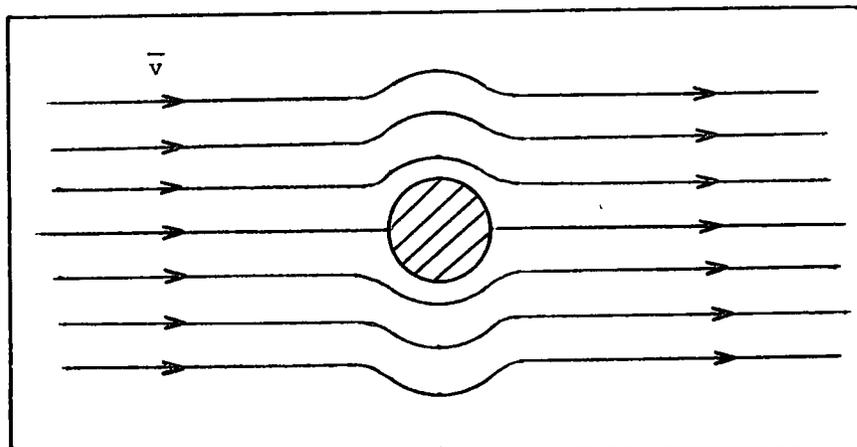

Thus

$$A = B a^2 = -v_0 a^2$$

Therefore

$$\bar{v} = v_0 \cos \theta \left(1 - \frac{a^2}{r^2}\right) \bar{i}_r - v_0 \sin \theta \left(1 + \frac{a^2}{r^2}\right) \bar{i}_\theta$$

Part b

PROBLEM 12.5 (continued)Part c

Using Bernoulli's law, we have

$$\frac{1}{2} \rho V_o^2 + p_o = \frac{1}{2} \rho V_o^2 \left( 1 + \frac{a^4}{r^4} - \frac{2a^2}{r^2} \cos 2\theta \right) + P$$

Therefore the pressure is

$$P = p_o - \frac{1}{2} \rho V_o^2 \left( \frac{a^4}{r^4} - \frac{2a^2}{r^2} \cos 2\theta \right)$$

Part d

We choose a large rectangular surface which encloses the cylinder, but the sides of which are far away from the cylinder. We write the momentum theorem as

$$\int_S \rho \bar{v} (\bar{v} \cdot \bar{n}) da = - \int_S P d\bar{a} + \bar{F}$$

where  $\bar{F}$  is the force which the cylinder exerts on the fluid. However, with our surface far away from the cylinder

$$\bar{v} = v_o \bar{i}_1$$

and the pressure is constant

$$P = p_o$$

Thus, integrating over the closed surface

$$\bar{F} = 0$$

The force which is exerted by the fluid on the cylinder is  $-\bar{F}$ , which, however, is still zero.

PROBLEM 12.6Part a

This problem is analogous to 12.5, only we are now working in spherical coordinates. As in Prob. 12.5,

$$\bar{V} = -\nabla\phi$$

In spherical coordinates, we try the solution to Laplace's equation

$$\phi = Ar \cos \theta + \frac{B}{r} \cos \theta \quad (a)$$

Theta is measured clockwise from the  $x_1$  axis.

Thus

$$\bar{V} = \left( -A \cos \theta + \frac{2B}{r^3} \cos \theta \right) \bar{i}_r + \bar{i}_\theta \left( A + \frac{B}{r^3} \right) \sin \theta \quad (b)$$

As  $r \rightarrow \infty$

$$\bar{V} \rightarrow V_o (\bar{i}_r \cos \theta - \bar{i}_\theta \sin \theta) \quad (c)$$

$$\text{Therefore } A = -V_o \quad (d)$$

At  $r = a$

$$V_r(a) = 0 \quad (e)$$

Thus

$$\frac{2B}{a^3} = A = -V_o$$

or

$$B = -\frac{V_o a^3}{2} \quad (f)$$

Therefore

$$\bar{V} = V_o \left( 1 - \frac{a^3}{r^3} \right) \cos \theta \bar{i}_r - V_o \left( 1 + \frac{a^3}{2r^3} \right) \sin \theta \bar{i}_\theta \quad (g)$$

with

$$r = \sqrt{x_1^2 + x_2^2 + x_3^2}$$

Part b

$$\text{At } r = a, \theta = \pi, \text{ and } \phi = -\frac{\pi}{2}$$

we are given that  $p = 0$

At this point

$$\bar{V} = 0$$

Therefore, from Bernoulli's law

$$p = -\frac{1}{2} \rho V_o^2 \left[ \left( 1 - \frac{a^3}{r^3} \right)^2 \cos^2 \theta + \sin^2 \theta \left( 1 + \frac{a^3}{2r^3} \right)^2 \right] \quad (h)$$

Part c

We realize that the pressure force acts normal to the sphere in the  $-\bar{i}_r$  direction.

PROBLEM 12.6 (continued)at  $r = a$ 

$$p = -\frac{9}{8} \rho V_0^2 \sin^2 \theta$$

We see that the magnitude of  $p$  remains unchanged if, for any value of  $\theta$ , we look at the pressure at  $\theta + \pi$ . Thus, by the symmetry, the force in the  $x_1$  direction is zero,

$$\bar{f}_1 = 0.$$

PROBLEM 12.7Part a

We are given the potential of the velocity field as

$$\phi = \frac{V_0}{a} x_1 x_2. \quad \bar{v} = -\nabla\phi = -\frac{V_0}{a} (x_2 \bar{i}_1 + x_1 \bar{i}_2)$$

If we sketch the equipotential lines in the  $x_1 x_2$  plane, we know that the velocity distribution will cross these lines at right angles, in the direction of decreasing potential.

Part b

$$\bar{a} = \frac{d\bar{v}}{dt} = \frac{\partial \bar{v}}{\partial t} + (\bar{v} \cdot \nabla) \bar{v}$$

$$= \left(\frac{V_0}{a}\right)^2 (x_1 \bar{i}_1 + x_2 \bar{i}_2) \tag{a}$$

$$\bar{a} = \left(\frac{V_0}{a}\right)^2 r \bar{i}_r \tag{b}$$

where

$$r = \sqrt{x_1^2 + x_2^2} \text{ and } \bar{i}_r \text{ is a unit vector in the radial direction.}$$

Part c

This flow could represent a fluid impinging normally on a flat plate, located along the line

$$x_1 + x_2 = 0. \quad \text{See sketches on next page.}$$

PROBLEM 12.8Part a

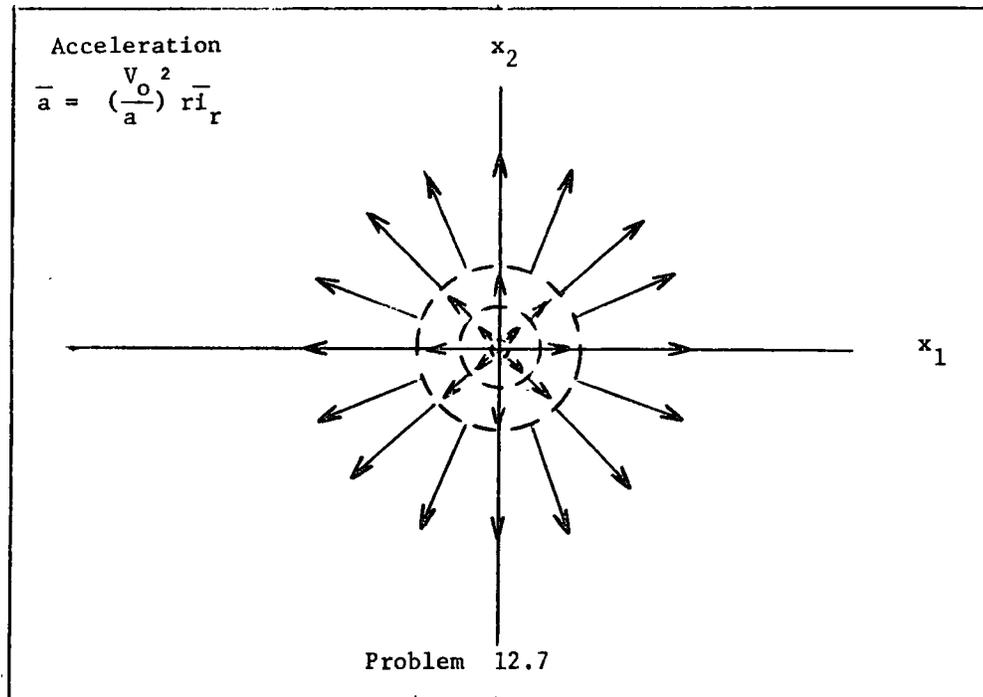

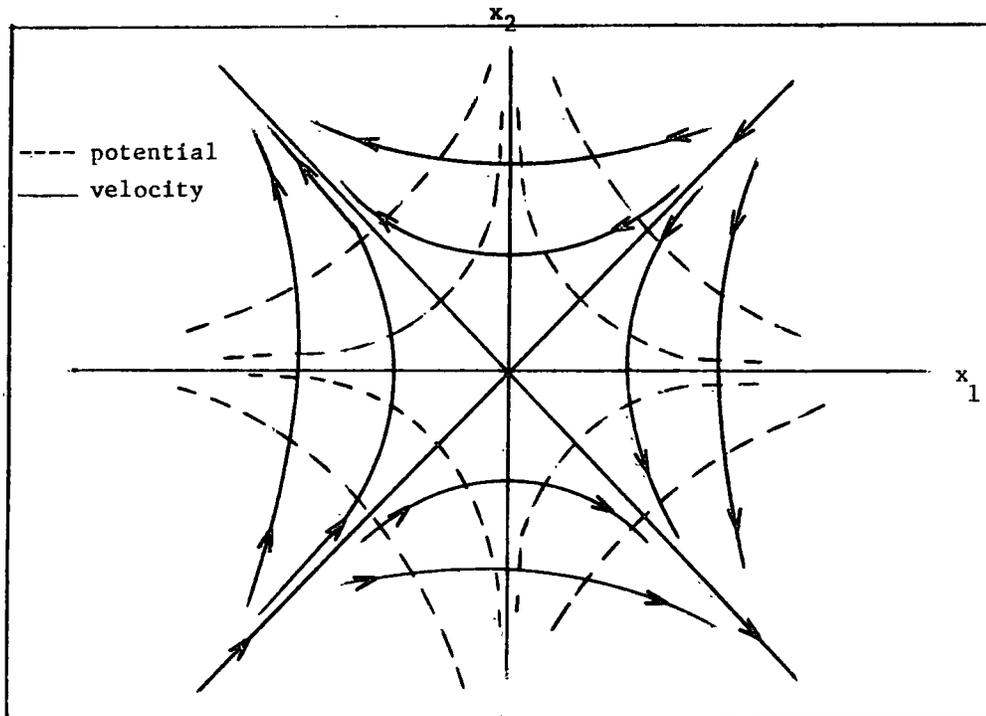

Given that

$$\bar{v} = \bar{i}_1 v_0 \frac{x_2}{a} + \bar{i}_2 v_0 \frac{x_1}{a} \tag{a}$$

we have that

$$\begin{aligned} \bar{a} &= \frac{d\bar{v}}{dt} = \frac{\partial \bar{v}}{\partial t} + (\bar{v} \cdot \nabla) \bar{v} \\ &= \left( v_1 \frac{\partial}{\partial x_1} + v_2 \frac{\partial}{\partial x_2} \right) \bar{v} \end{aligned} \tag{b}$$

ELECTROMECHANICS OF INCOMPRESSIBLE, INVISCID FLUIDS

ELECTROMECHANICS OF INCOMPRESSIBLE, INVISCID FLUIDS

PROBLEM 12.8 (Continued)

Thus

$$\bar{a} = v_o^2 \frac{x_1}{a^2} \bar{i}_1 + \left(\frac{v_o}{a}\right)^2 x_2 \bar{i}_2 \quad (c)$$

Part b

Using Bernoulli's law, we have

$$p_o = \frac{1}{2} \rho \left(\frac{v_o}{a}\right)^2 (x_2^2 + x_1^2) + p \quad (d)$$

$$\begin{aligned} p &= p_o - \frac{1}{2} \rho \left(\frac{v_o}{a}\right)^2 (x_2^2 + x_1^2) \\ &= p_o - \frac{1}{2} \rho v_o^2 \frac{r^2}{a^2} \end{aligned} \quad (e)$$

where

$$r = \sqrt{x_1^2 + x_2^2}$$

PROBLEM 12.9

Part a

The addition of a gravitational force will not change the velocity from that of Problem 12.8. Only the pressure will change. Therefore,

$$\bar{v} = \bar{i}_1 \frac{v_o}{a} x_2 + \bar{i}_2 \frac{v_o}{a} x_1 \quad (a)$$

Part b

The boundary conditions at the walls are that the normal component of the velocity must be zero at the walls. Consider first the wall

$$x_2 - x_1 = 0 \quad (b)$$

We take the gradient of this expression to find a normal vector to the curve. (Note that this normal vector does not have unit magnitude.)

$$\bar{n} = \bar{i}_2 - \bar{i}_1 \quad (c)$$

Then

$$\bar{v} \cdot \bar{n} = \frac{v_o}{a} (x_1 - x_2) = 0 \quad (d)$$

Thus, the boundary condition is satisfied along this wall.

Similarly, along the wall

$$x_2 + x_1 = 0 \quad (e)$$

$$\bar{n} = \bar{i}_2 + \bar{i}_1 \quad (f)$$

and

$$\bar{v} \cdot \bar{n} = \frac{v_o}{a} (x_1 + x_2) = 0 \quad (g)$$

Thus, the boundary condition is satisfied here. Along the parabolic wall

$$x_2^2 - x_1^2 = a^2 \quad (h)$$

$$\bar{n} = x_2 \bar{i}_2 - x_1 \bar{i}_1 \quad (i)$$

PROBLEM 12.9 (Continued)

$$\vec{v} \cdot \vec{n} = \frac{v_0}{a} (x_1 x_2 - x_1 x_2) = 0 \quad (j)$$

Thus, we have shown that along all the walls, the fluid flows purely tangential to these walls.

PROBLEM 12.10

Part a

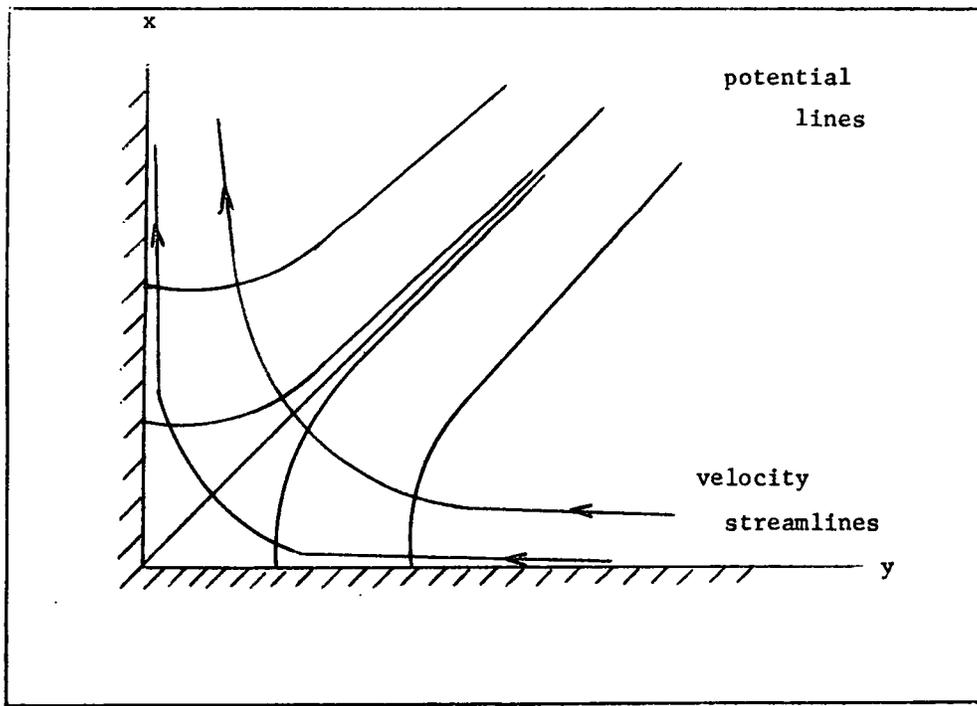

Along the lines  $x = 0$  and  $y = 0$ , the normal component of the velocity must be zero. In terms of the potential, we must then have

$$\left. \frac{\partial \phi}{\partial x} \right|_{x=0} = 0 \quad (a)$$

and

$$\left. \frac{\partial \phi}{\partial y} \right|_{y=0} = 0 \quad (b)$$

To aid in the sketch of  $\phi(x,y)$ , we realize that since at the boundary the velocity must be purely tangential, the potential lines must come in normal to the walls.

Part b

For the fluid to be irrotational and incompressible, the potential must obey

PROBLEM 12.10 (Continued)

Laplace's equation

$$\nabla^2 \phi = 0 \quad (c)$$

From our sketch of part (a), and from the boundary conditions, we guess a solution of the form

$$\phi = -\frac{v_0}{a} (x^2 - y^2) \quad (d)$$

where  $\frac{v_0}{a}$  is a scaling constant. By direct substitution, we see that this solution satisfies all the conditions.

Part c

For the potential of part (b), the velocity is

$$\bar{v} = -\nabla\phi = 2\frac{v_0}{a} (x\bar{i}_x - y\bar{i}_y) \quad (e)$$

Using Bernoulli's equation, we obtain

$$p_0 = p + 2\left(\frac{v_0}{a}\right)^2 (x^2 + y^2) \quad (f)$$

The net force on the wall between  $x=c$  and  $x=d$  is

$$\bar{f} = \int_{z=0}^{z=w} \int_{x=c}^{x=d} (p_0 - p) dx dz \bar{i}_y \quad (g)$$

where  $w$  is the depth of the wall.

Thus

$$\begin{aligned} \bar{f} &= +\frac{\left(\frac{v_0}{a}\right)^2}{6} w \int_c^d x^2 dx \bar{i}_y \\ &= +\frac{\left(\frac{v_0}{a}\right)^2}{6} w (d^3 - c^3) \bar{i}_y \end{aligned} \quad (h)$$

Part d

The acceleration is

$$\bar{a} = (\bar{v} \cdot \nabla) \bar{v} = 2\frac{v_0}{a} x \left(2\frac{v_0}{a} \bar{i}_x\right) - 2\frac{v_0}{a} y \left(-2\frac{v_0}{a} y \bar{i}_y\right).$$

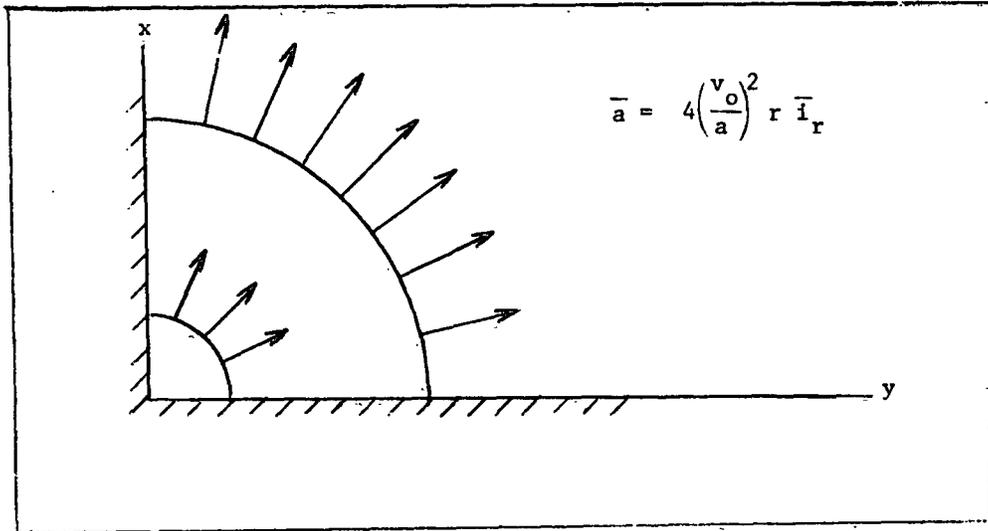

or

$$\bar{a} = 4\left(\frac{v_0}{a}\right)^2 (x\bar{i}_x + y\bar{i}_y) \quad (i)$$

or in cylindrical coordinates

$$\bar{a} = 4\left(\frac{v_0}{a}\right)^2 r \bar{i}_r \quad (j)$$

PROBLEM 12.10 (Continued)

PROBLEM 12.11

Part a

Since the  $\nabla \cdot \bar{v} = 0$ , we must have

$$V_0 h = v_x(x) (h - \xi) \quad (a)$$

or

$$v_x(x) = \frac{V_0 h}{h - \xi} \approx V_0 \left( 1 + \frac{\xi}{h} \right) \quad (b)$$

Part b

Using Bernoulli's law, we have

$$\frac{1}{2} \rho V_0^2 + p_0 = \frac{1}{2} \rho [v_x(x)]^2 + P \quad (c)$$

$$P = P_0 + \frac{1}{2} \rho V_0^2 - \frac{1}{2} \rho V_0^2 \left( 1 + \frac{\xi}{h} \right)^2 \quad (d)$$

Part c

We linearize  $P$  around  $\xi = 0$  to obtain

$$P \approx P_0 - \rho V_0^2 \frac{\xi}{h} \quad (e)$$

Thus

$$T_z = -P + P_0 = \rho V_0^2 \frac{\xi}{h} \quad (f)$$

ELECTROMECHANICS OF INCOMPRESSIBLE, INVISCID FLUIDS

PROBLEM 12.11 (continued)

Thus  $T_z = C\xi$  (g)

with  $C = \frac{\rho V_o^2}{h}$

Part d

We can write the equations of motion of the membrane as

$$\sigma_m \frac{\partial^2 \xi}{\partial t^2} = S \frac{\partial^2 \xi}{\partial x^2} + T_z \quad (h)$$

$$= S \frac{\partial^2 \xi}{\partial x^2} + C\xi \quad (i)$$

We assume

$$\xi(x,t) = \text{Re } \hat{\xi} e^{j(\omega t - kx)} \quad (j)$$

Solving for the dispersion relation, we obtain

$$-\sigma_m \omega^2 = -Sk^2 + C \quad (k)$$

or

$$\omega = \left[ \frac{S}{\sigma_m} k^2 - \frac{C}{\sigma_m} \right]^{1/2} \quad (l)$$

Now, since the membrane is fixed at  $x = 0$  and  $x = L$ , we know that

$$k = \frac{n\pi}{l} \quad n = 1, 2, 3, \dots \quad (m)$$

Now if

$$S \left( \frac{\pi}{l} \right)^2 - C < 0 \quad (n)$$

we realize that the membrane will become unstable.

So for

$$\frac{\rho V_o^2}{h} < S \left( \frac{\pi}{l} \right)^2 \quad (o)$$

we have stability.

Part e

As  $\xi$  increases, the velocity of the flow above the membrane increases, since the fluid is incompressible. Through Bernoulli's law, the pressure on the membrane must decrease, thereby increasing the net upwards force on the membrane, which tends to make  $\xi$  increase even further, thus making the membrane become unstable.

PROBLEM 12.12Part a

We wish to write the equation of motion for the membrane.

$$\sigma_m \frac{\partial^2 \xi}{\partial t^2} = S \frac{\partial^2 \xi}{\partial x^2} + p_1(\xi) - p_o + T^e - \sigma_m g \quad (a)$$

where

$$T^e = \frac{\epsilon_o}{2} \left( \frac{V_o}{d-\xi} \right)^2 \approx \frac{\epsilon_o}{2} \frac{V_o^2}{d^2} \left( 1 + \frac{2\xi}{d} \right)$$

is the electric force per unit area on the membrane.

In the equilibrium  $\xi(x,t) = 0$ , we must have

$$p_1(0) = p_o - \frac{\epsilon_o}{2} \left( \frac{V_o}{d} \right)^2 + \sigma_m g \quad (b)$$

As in example 12.1.3

$$p_1 = -\rho g y + C$$

and, using the boundary condition of (b), we obtain

$$p_1 = -\rho g y + \sigma_m g + p_o - \frac{\epsilon_o}{2} \left( \frac{V_o}{d} \right)^2 \quad (c)$$

Part b

We are interested in calculating the perturbations in  $p_1$  for small deflections of the membrane. From Bernoulli's law, a constant of motion of the fluid is  $D$ , where  $D$  equals

$$D = \frac{1}{2} \rho U^2 + \sigma_m g + p_o - \frac{\epsilon_o}{2} \left( \frac{V_o}{d} \right)^2 \quad (d)$$

For small perturbations  $\xi(x,t)$ , the velocity in the region  $0 \leq x \leq L$  is

$$v = \frac{Ud}{d+\xi}$$

We use Bernoulli's law to write

$$\frac{1}{2} \rho v^2 + p_1(\xi) + \rho g \xi = D \quad (e)$$

Since we have already taken care of the equilibrium terms, we are interested only in small changes of  $p_1$ , so we omit constant terms in our linearization of  $p_1$ .

Thus

$$p_1(\xi) = -\rho g \xi + \frac{\rho U^2 \xi}{d} \quad (f)$$

Thus, our linearized force equation is

$$\sigma_m \frac{\partial^2 \xi}{\partial t^2} = S \frac{\partial^2 \xi}{\partial x^2} + \left( \frac{\rho U^2}{d} - \rho g + \frac{\epsilon_o V_o^2}{d^3} \right) \xi \quad (g)$$

We define

$$C = -\rho g + \frac{\rho U^2}{d} + \frac{\epsilon_o V_o^2}{d^3}$$

and assume solutions of the form

$$\xi(x,t) = \text{Re } \hat{\xi} e^{j(\omega t - kx)}$$

PROBLEM 12.12 (Continued)

from which we obtain the dispersion relation

$$\omega = \left( \frac{S}{\sigma_m} k^2 - \frac{C}{\sigma_m} \right)^{1/2} \quad (h)$$

Since the membrane is fixed at  $x=0$  and at  $x=L$

$$k = \frac{n\pi}{L} \quad n = 1, 2, 3, \dots \quad (i)$$

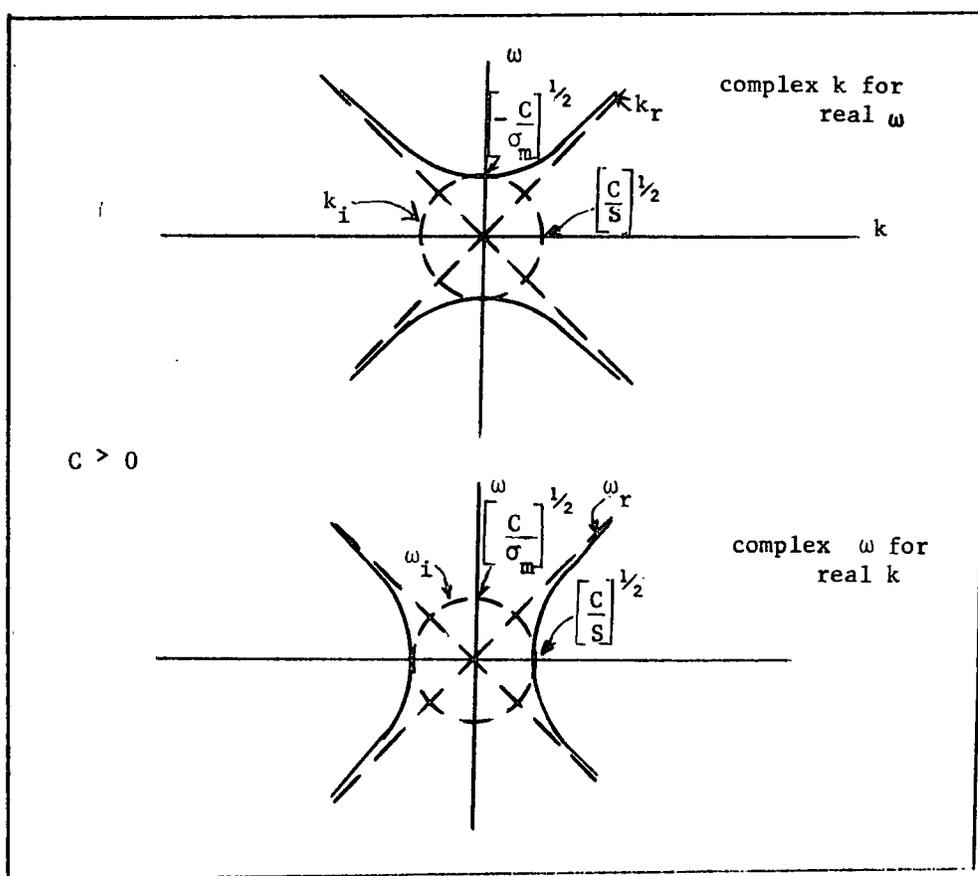

If  $C < 0$ , then  $\omega$  is always real, and we can have oscillation about the equilibrium. For  $C > S\left(\frac{\pi}{L}\right)^2$ , then  $\omega$  will be imaginary, and the system is unstable.

Part c

The dispersion relation is thus

$$\omega = \left( \frac{S}{\sigma_m} k^2 - \frac{C}{\sigma_m} \right)^{1/2}$$

Consider first  $C < 0$

PROBLEM 12.12 (Continued)

Part d

Since the membrane is not moving, one wave propagates upstream and the other propagates downstream. Thus, to find the solution we need two boundary conditions, one upstream and one downstream. If, however, both waves had propagated downstream, then causality does not allow us to apply a downstream boundary condition. This is not the case here.

PROBLEM 12.13

Part a

Since  $\nabla \cdot \vec{v} = 0$ , in the region  $0 \leq x \leq L$ ,

$$v_x = \frac{V_o d}{d + \xi_1 - \xi_2} \approx v_o \left[ 1 - \frac{(\xi_1 - \xi_2)}{d} \right] \quad (a)$$

where  $d$  is the spacing between membranes. Using Bernoulli's law, we can find the pressure  $p_1$  right below membrane 1, and pressure  $p_2$  right above membrane 2.

Thus

$$\frac{1}{2} \rho V_o^2 + p_o = \frac{1}{2} \rho v_x^2 + p_1 \quad (b)$$

and

$$\frac{1}{2} \rho V_o^2 + p_o = \frac{1}{2} \rho v_x^2 + p_2 \quad (c)$$

Thus

$$p_1 = p_2 \approx p_o + \frac{\rho V_o^2 (\xi_1 - \xi_2)}{d} \quad (d)$$

We may now write the equations of motion of the membranes as

$$\sigma_m \frac{\partial^2 \xi_1}{\partial t^2} = S \frac{\partial^2 \xi_1}{\partial x^2} + (p_1 - p_o) = S \frac{\partial^2 \xi_1}{\partial x^2} + \frac{\rho V_o^2 (\xi_1 - \xi_2)}{d} \quad (e)$$

$$\sigma_m \frac{\partial^2 \xi_2}{\partial t^2} = S \frac{\partial^2 \xi_2}{\partial x^2} + p_o - p_2 = S \frac{\partial^2 \xi_2}{\partial x^2} - \frac{\rho V_o^2 (\xi_1 - \xi_2)}{d} \quad (f)$$

Assume solutions of the form

$$\xi_1 = \text{Re } \hat{\xi}_1 e^{j(\omega t - kx)} \quad (g)$$

$$\xi_2 = \text{Re } \hat{\xi}_2 e^{j(\omega t - kx)}$$

Substitution of these assumed solutions into our equations of motion will yield the dispersion relation

$$\begin{aligned} -\sigma_m \omega^2 \hat{\xi}_1 &= -S k^2 \hat{\xi}_1 + \frac{\rho V_o^2}{d} (\hat{\xi}_1 - \hat{\xi}_2) \\ -\sigma_m \omega^2 \hat{\xi}_2 &= -S k^2 \hat{\xi}_2 + \frac{\rho V_o^2}{d} (\hat{\xi}_2 - \hat{\xi}_1) \end{aligned} \quad (h)$$

These equations may be rewritten as

PROBLEM 12.13 (Continued)

$$\begin{aligned} \hat{\xi}_1 \left[ -\sigma_m \omega^2 + Sk^2 - \frac{\rho V_o^2}{d} \right] + \hat{\xi}_2 \left[ + \frac{\rho V_o^2}{d} \right] &= 0 \\ \hat{\xi}_1 \left[ \frac{\rho V_o^2}{d} \right] + \hat{\xi}_2 \left[ -\sigma_m \omega^2 + Sk^2 - \frac{\rho V_o^2}{d} \right] &= 0 \end{aligned} \tag{i}$$

For non-trivial solution, the determinant of coefficients of  $\xi_1$  and  $\xi_2$  must be zero.

Thus 
$$\left[ -\sigma_m \omega^2 + Sk^2 - \frac{\rho V_o^2}{d} \right]^2 = \left[ \frac{\rho V_o^2}{d} \right]^2 \tag{j}$$

or 
$$-\sigma_m \omega^2 + Sk^2 - \frac{\rho V_o^2}{d} = \pm \frac{\rho V_o^2}{d} \tag{k}$$

If we take the upper sign (+) on the right-hand side of the above equation, we obtain

$$\omega = \left[ \frac{S}{\sigma_m} k^2 - \frac{2\rho V_o^2}{\sigma_m d} \right]^{1/2} \tag{l}$$

We see that if  $V_o$  is large enough,  $\omega$  can be imaginary. This can happen when

$$V_o^2 > \frac{Sk^2 d}{2\rho} \tag{m}$$

Since the membranes are fixed at  $x=0$  and  $x=L$

$$k = \frac{n\pi}{L} \quad n = 1, 2, 3, \dots \tag{n}$$

So the membranes first become unstable when

$$V_o^2 > \frac{S \left( \frac{\pi}{L} \right)^2 d}{2\rho} \tag{o}$$

For this choice of sign (+),  $\xi_1 = -\xi_2$ , so we excite the odd mode. If we had taken the negative sign, then the even mode would be excited

$$\xi_1 = \xi_2.$$

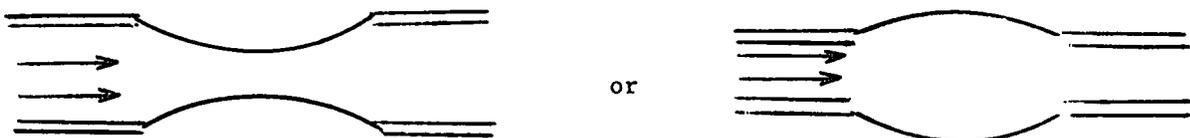

However, the dispersion relation is then

$$\omega = \pm \frac{S}{\sigma_m} k$$

and then we would have no instability.

Part b

The odd mode is unstable.

PROBLEM 12.14Part a

The force equation in the y direction is

$$\frac{\partial p}{\partial y} = -\rho g \quad (a)$$

Thus

$$p = -\rho g(y-\xi) \quad (b)$$

where we have used the fact that at  $y = \xi$ , the pressure is zero.

Part b

$\nabla \cdot \bar{v} = 0$  implies

$$\frac{\partial v_x}{\partial x} + \frac{\partial v_y}{\partial y} = 0 \quad (c)$$

Integrating with respect to y, we obtain

$$v_y = -\frac{\partial v_x}{\partial x} y + C \quad (d)$$

where C is a constant of integration to be evaluated by the boundary condition at  $y = -a$ , that

$$v_y(y = -a) = 0$$

since we have a rigid bottom at  $y = -a$ .

Thus

$$v_y = -\frac{\partial v_x}{\partial x} (y+a) \quad (e)$$

Part c

The x-component of the force equation is

$$\rho \frac{\partial v_x}{\partial t} = -\frac{\partial p}{\partial x} = -\rho g \frac{\partial \xi}{\partial x} \quad (f)$$

or

$$\frac{\partial v_x}{\partial t} = -g \frac{\partial \xi}{\partial x} \quad (g)$$

Part d

At  $y = \xi$ ,

$$v_y = \frac{\partial \xi}{\partial t} \quad (h)$$

Thus, from part (b), at  $y = \xi$

$$\frac{\partial \xi}{\partial t} = -\frac{\partial v_x}{\partial x} (\xi+a) \quad (i)$$

However, since  $\xi \ll a$ , and  $v_x$  and  $v_y$  are small perturbation quantities, we can approximately write

$$\frac{\partial \xi}{\partial t} = -a \frac{\partial v_x}{\partial x} \quad (j)$$

Part e

Our equations of motion are now

PROBLEM 12.14 (Continued)

$$\frac{\partial \xi}{\partial t} = -a \frac{\partial v_x}{\partial x} \quad (k)$$

and

$$\frac{\partial v_x}{\partial t} = -g \frac{\partial \xi}{\partial x} \quad (l)$$

If we take  $\partial/\partial x$  of (k) and  $\partial/\partial t$  of (l) and then simplify, we obtain

$$\frac{\partial^2 v_x}{\partial t^2} = ag \frac{\partial^2 v_x}{\partial x^2} \quad (m)$$

We recognize this as the wave equation for gravity waves, with phase velocity

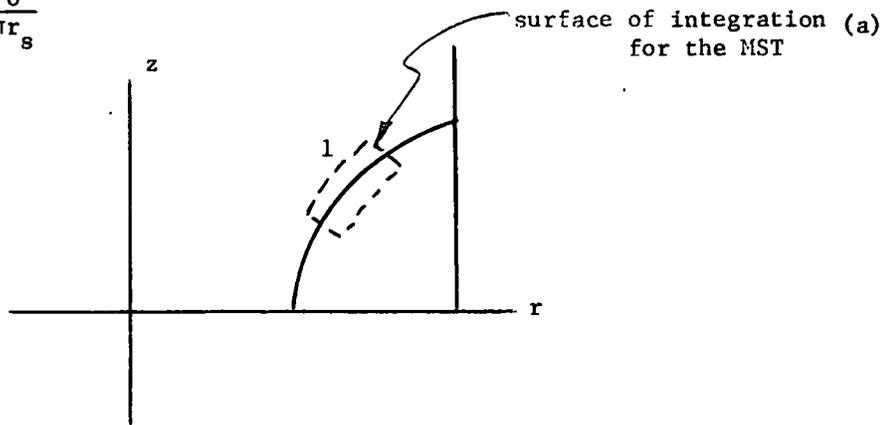

$$v_p = \sqrt{ag} \quad (n)$$

PROBLEM 12.15

Part a

As shown in Fig. 12P.15b, the H field is in the  $-\hat{i}$  direction with magnitude:

$$|H_s| = \frac{I_o}{2\pi r_s}$$

If we integrate the MST along the surface defined in the above figure, the only contribution will be along surface (1), so we obtain for the normal traction

$$\tau_n = -\frac{1}{2} \mu_o |H_s|^2 = -\frac{1}{8} \frac{\mu_o I_o^2}{\pi^2 r_s^2} \quad (b)$$

Part b

Since the net force on the interface must be zero, we must have

$$\tau_n + p_{int} - p_o = 0 \quad (c)$$

where  $p_{int}$  is the hydrostatic pressure on the fluid side of the interface.

ELECTROMECHANICS OF INCOMPRESSIBLE, INVISCID FLUIDS

PROBLEM 12.15 (continued)

Thus 
$$p_{int} = p_o + \frac{1}{8} \frac{\mu_o I_o^2}{\pi^2 r^2} \quad (d)$$

Within the fluid, the pressure  $p$  must obey the relation

$$\frac{\partial p}{\partial z} = -\rho g \quad (e)$$

or 
$$p = -\rho g z + C \quad (f)$$

Let us look at the point  $z = z_o$ ,  $r = R_o$ . There

$$p = -\rho g z_o + C = p_o + \frac{1}{8} \frac{\mu_o I_o^2}{\pi^2 R_o^2} \quad (g)$$

Therefore

$$C = \rho g z_o + p_o + \frac{1}{8} \frac{\mu_o I_o^2}{\pi^2 R_o^2} \quad (h)$$

Now let's look at any point on the interface with coordinates  $z_s$ ,  $r_s$

Then, by Bernoulli's law,

$$p_o + \frac{1}{8} \frac{\mu_o I_o^2}{\pi^2 R_o^2} + \rho g z_o = \frac{1}{8} \frac{\mu_o I_o^2}{\pi^2 r_s^2} + p_o + \rho g z_s \quad (i)$$

Thus, the equation of the surface is

$$\rho g z_s + \frac{1}{8} \frac{\mu_o I_o^2}{\pi^2 r_s^2} = \rho g z_o + \frac{1}{8} \frac{\mu_o I_o^2}{\pi^2 R_o^2} \quad (j)$$

Part c

The total volume of the fluid is

$$V = \pi [R_o^2 - (\frac{b}{2})^2] a. \quad (k)$$

We can find the value of  $z_o$  by finding the volume of the deformed fluid in terms of  $z_o$ , and then equating this volume to  $V$ .

Thus 
$$V = \pi [R_o^2 - (\frac{b}{2})^2] a = 2\pi \int_{r=r_o}^{R_o} \int_{z=0}^{z_o + \frac{1}{8} \frac{\mu_o I_o^2}{\rho g \pi^2} \left( \frac{1}{R_o^2} - \frac{1}{r^2} \right)} r dr dz \quad (l)$$

where

$r_o$  is that value of  $r$  when  $z = 0$ , or

$$r_o = \left[ \frac{\frac{1}{8} \frac{\mu_o I_o^2}{\pi^2}}{\rho g z_o + \frac{1}{8} \frac{\mu_o I_o^2}{\pi^2 R_o^2}} \right]^{1/2} \quad (m)$$

Evaluating this integral, and equating to  $V$ , will determine  $z_o$ .

PROBLEM 12.16

We do an analysis similar to that of Sec. 12.2.1a, to obtain

$$E = - \bar{i}_y \frac{V}{w} \tag{a}$$

and

$$\bar{J} = \bar{i}_y \sigma \left( -\frac{V}{w} + vB \right) = \frac{I}{\ell d} \bar{i}_y \tag{b}$$

Here

$$V = IR + V_o \tag{c}$$

Thus

$$I = \frac{vBw - V_o}{R + \frac{w}{\ell d \sigma}}$$

The electric power out is

$$P_e = VI = (IR + V_o)I = \left[ V_o + \frac{R(vBw - V_o)}{R + \frac{w}{\ell d \sigma}} \right] \left[ \frac{vBw - V_o}{R + \frac{w}{\ell d \sigma}} \right] \tag{e}$$

From equations (12.2.23 - 12.2.25)

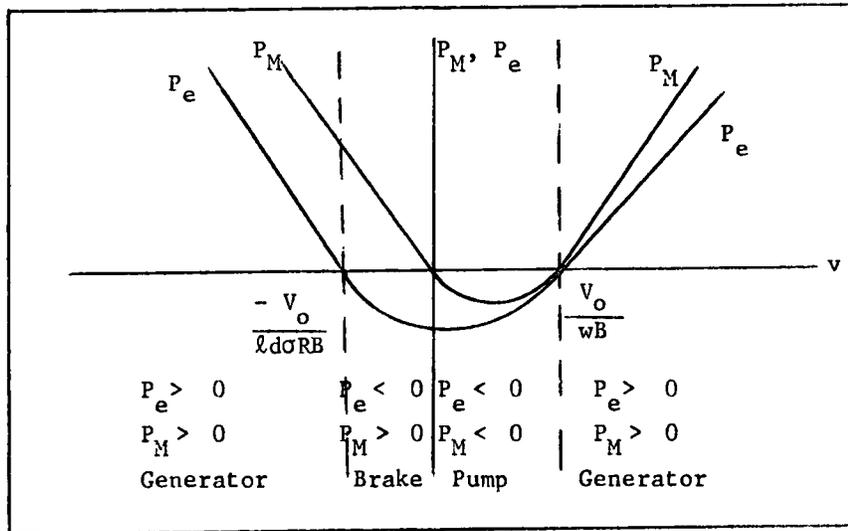

we have

$$\Delta p = p(0) - p(\ell) = \frac{IB}{d} \tag{f}$$

Thus, the mechanical power in is

$$P_M = (\Delta p w d) v = \frac{Bw(vBw - V_o)v}{R + \frac{w}{\ell d \sigma}} \tag{g}$$

Plots of  $P_E$  and  $P_M$  versus  $v$  specify the operating regions of the MHD machine.

PROBLEM 12.17

Part a

The mechanical power input is

$$P_M = - \int_{z=0}^L \int_{y=0}^w \int_{x=0}^d \nabla p v_o dx dy dz \quad (a)$$

The force equation in the steady state is

$$- \nabla p + f^e = 0 \quad (b)$$

where

$$f^e = - J_y B_o \quad (c)$$

Thus

$$P_M = \int_{z=0}^L \int_{y=0}^w \int_{x=0}^d J_y B_o v_o dx dy dz \quad (d)$$

Now

$$J_y = \sigma(E_y + v_o B_o) = \sigma(-\frac{\partial \phi}{\partial y} + v_o B_o) \quad (e)$$

Integrating, we obtain

$$\begin{aligned} P_M &= \sigma v_o^2 B_o L w d - \sigma B_o v_o V L d \\ &= \frac{v_{oc}^2}{R_i} - \frac{V v_{oc}}{R_i} = \frac{1}{R_i} (v_{oc} - V) v_{oc} \end{aligned} \quad (f)$$

Part b

Defining  $\eta = \frac{P_{out}}{P_M}$

we have

$$\eta = \frac{(v_{oc} - V)v - aV^2}{(v_{oc} - V)v_{oc}} \quad (g)$$

First, we wish to find what terminal voltage maximizes  $P_{out}$ . We take

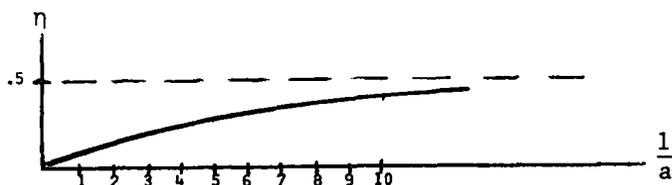

$$\frac{\partial P_{out}}{\partial V} = 0 \text{ and find that}$$

$$V = \frac{v_{oc}}{2(1+a)} \text{ maximizes } P_{out}.$$

For this value of  $V$ ,  $\eta$  equals

$$\eta = \frac{1}{2} \frac{1}{(1+2a)} \quad (h)$$

Plotting  $\eta$  vs.  $\frac{1}{a}$  gives

PROBLEM 12.17(Continued)

Now, we wish to find what voltage will give maximum efficiency, so we take

$$\frac{\partial \eta}{\partial V} = 0$$

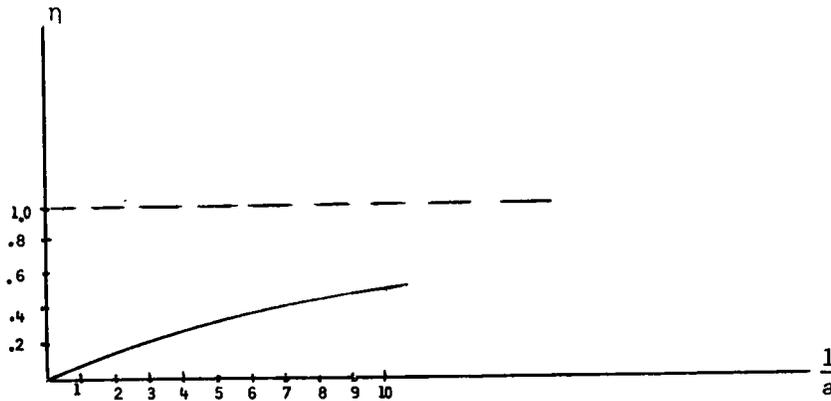

Solving for the maximum, we obtain

$$V = V_{oc} \left[ 1 \pm \sqrt{\frac{a}{1+a}} \right] \quad (i)$$

We choose the negative sign, since  $V < V_{oc}$  for generator operation. We thus obtain

$$\eta = 1 + 2a - 2\sqrt{a(1+a)} \quad (j)$$

Plotting  $\eta$  vs.  $\frac{1}{a}$ , we obtain

PROBLEM 12.18

From Fig. 12P.18, we have

$$\vec{E} = \frac{V}{w} \vec{i}_y$$

and

$$\vec{J} = \vec{i}_y \sigma \left[ \frac{V}{w} + vB \right] = \frac{I}{LD} \vec{i}_y \quad (b)$$

The z component of the force equation is

$$-\frac{\partial p}{\partial z} - \frac{I}{LD} B = 0 \quad (c)$$

or 
$$\Delta p = p_i - p_o = \frac{IB}{D} = \Delta p_o \left( 1 - \frac{v}{v_o} \right) \quad (d)$$

Solving for v, we obtain

$$v = \left( 1 - \frac{IB}{D\Delta p_o} \right) v_o \quad (e)$$

PROBLEM 12.18 (Continued)

Thus, we have

$$\frac{I}{LD\sigma} = \frac{V}{w} + B\left(1 - \frac{IB}{D\Delta p_o}\right)v_o \quad (f)$$

or

$$V = I\left(\frac{w}{LD\sigma} + \frac{B^2 v_o w}{D\Delta p_o}\right) - v_o Bw \quad (g)$$

Thus, for our equivalent circuit

$$R'_i = \frac{w}{LD\sigma} + \frac{v_o w B^2}{D\Delta p_o} \quad (h)$$

and

$$V_{oc} = -v_o w B \quad (i)$$

We notice that the current  $I$  in Fig. 12P.18b is not consistent with that of Fig. 12P.18a. It should be defined flowing in the other direction.

PROBLEM 12.19

Using Ampere's law

$$H_o = \frac{N_o I_o + N_L I_L}{d} \quad (a)$$

Within the fluid

$$\bar{J} = \frac{I_L}{\ell d} \bar{i}_z = \sigma\left(-\frac{V_L}{w} + v\mu_o H_o\right)\bar{i}_z \quad (b)$$

Simplifying, we obtain

$$I_L \left[ \frac{1}{\ell d} - \frac{\sigma v \mu_o N_L}{d} \right] = \frac{\sigma v \mu_o N_o I_o}{d} - \frac{\sigma V_L}{w} \quad (c)$$

For  $V_L$  to be independent of  $I_L$ , we must have

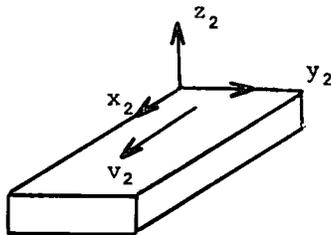

$$\frac{\sigma v \mu_o N_L}{d} = \frac{1}{\ell d} \quad (d)$$

or

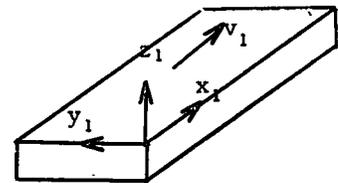

$$N_L = \frac{1}{\ell \sigma v \mu_o} \quad (e)$$

PROBLEM 12.20

We define coordinate systems as shown below.

MHD #2.

MHD # 1

PROBLEM 12.20 (Continued)

Now, since  $\nabla \cdot \bar{v} = 0$ , we have

$$v_1 w_1 d_1 = v_2 w_2 d_2$$

In system (2),

$$\bar{J}_2 = \bar{i}_{y2} \frac{I_2}{\ell_2 d_2} = -\sigma \left( \frac{V_2}{w_2} + v_2 B \right) \bar{i}_{y2} \quad (a)$$

and

$$\Delta p_2 = p(0_+) - p(\ell_{2-}) = -\frac{I_2 B}{d_2} \quad (b)$$

In system (1),

$$\bar{J}_1 = \bar{i}_{y1} \frac{I_1}{\ell_1 d_1} = \sigma \left( \frac{V_1}{w_1} - v_1 B \right) \quad (c)$$

and

$$\Delta p_1 = p(0_+) - p(\ell_{1-}) = -\frac{I_1 B}{d_1} \quad (d)$$

By applying Bernoulli's law at the points  $x_1 = 0_-$  (right before MHD system 1) and at  $x_1 = \ell_{1+}$  (right after MHD system 1), we obtain

$$\frac{1}{2} \rho v_1^2 + p_1(0_-) = \frac{1}{2} \rho v_1^2 + p_1(\ell_{1+}) \quad (e)$$

or

$$p_1(0_-) = p_1(\ell_{1+}) \quad (f)$$

Similarly on MHD system (2):

$$p_2(0_-) = p_2(\ell_{2+}) \quad (g)$$

Now,

$$\oint_C \nabla p \cdot d\ell = 0$$

Applying this relation to a closed contour which follows the shape of the channel, we obtain

$$\begin{aligned} \oint_C \nabla p \cdot d\ell &= \int_{x_1=0_+}^{\ell_{1-}} \nabla p \cdot d\ell + \int_{x_1=\ell_{1+}}^{x_2=0_-} \nabla p \cdot d\ell + \int_{x_2=0_+}^{x_2=\ell_{2-}} \nabla p \cdot d\ell + \int_{x_2=\ell_{2+}}^{x_1=0_-} \nabla p \cdot d\ell \\ &= p_1(\ell_{1-}) - p_1(0_+) + p_2(0_-) - p_1(\ell_{1+}) + p_2(\ell_{2-}) \\ &\quad - p_2(0_+) + p_1(0_-) - p_2(\ell_{2+}) \end{aligned} \quad (h)$$

From (f) and (g) we reduce this to

$$\Delta p_1 + \Delta p_2 = 0 \quad (i)$$

or

$$\frac{I_1}{d_1} = -\frac{I_2}{d_2} \quad (j)$$

PROBLEM 12.20 (Continued)

Thus, we may express  $v_1$  as

$$v_1 = \left( + \frac{I_2}{\ell_1 d_2 \sigma} + \frac{V_1}{w_1} \right) \frac{1}{B} \quad (k)$$

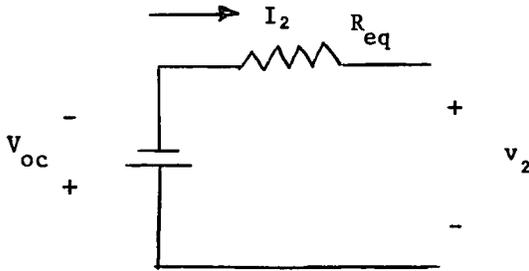

We substitute this into our original equation for  $J_2$  (a), to obtain

$$\frac{I_2}{\ell_2 d_2} = -\sigma \frac{V_2}{w_2} - \sigma \left( \frac{w_1 d_1}{w_2 d_2} \right) \left( \frac{I_2}{\ell_1 d_2 \sigma} + \frac{V_1}{w_1} \right) \quad (l)$$

This may be rewritten as

$$V_2 = -I_2 \frac{w_2}{\sigma} \left[ \frac{1}{\ell_2 d_2} + \frac{w_1 d_1}{w_2 \ell_1 d_2^2} \right] - \frac{d_1}{d_2} V_1 \quad (m)$$

The Thevenin equivalent circuit is:

where

$$V_{oc} = \frac{d_1}{d_2} V_1$$

and

$$R_{eq} = \frac{w_2}{\sigma d_2} \left[ \frac{1}{\ell_2} + \frac{w_1 d_1}{w_2 d_2 \ell_1} \right]$$

PROBLEM 12.21

For the MHD system

$$|\bar{J}| = \frac{I}{LW} = \sigma \left( \frac{V_o}{D} - v \mu_o H_o \right) \quad (a)$$

and

$$\Delta p = p_1 - p_2 = + \frac{I \mu_o H_o}{w} \quad (b)$$

Now, since

$$\oint_C \nabla p \cdot d\ell = 0 \quad (c)$$

we must have

$$\Delta p = kv = \mu_o H_o L \sigma \left( \frac{V_o}{D} - v \mu_o H_o \right) \quad (d)$$

Solving for  $v$ , we obtain

$$v = \frac{\mu_o H_o L \sigma V_o}{D [k + (\mu_o H_o)^2 L \sigma]} \quad (e)$$

ELECTROMECHANICS OF INCOMPRESSIBLE, INVISCID FLUIDS

PROBLEM 12.22

Part a

We assume that the fluid flows in the  $+x$  direction with velocity  $v$ .

Thus

$$\bar{J} = \bar{i}_3 \frac{I}{Lw} = \sigma \left( \frac{V}{d} + v\mu_o H_o \right) \bar{i}_3 \quad (a)$$

where  $I$  is defined as flowing out of the positive terminal of the voltage source  $V_o$ .

We write the  $x_1$  component of the force equation as

$$-\frac{\partial p}{\partial x_1} - \frac{I\mu_o H_o}{Lw} - \rho g = 0 \quad (b)$$

Thus

$$p = - \left( \frac{I\mu_o H_o}{Lw} + \rho g \right) x_1 \quad (c)$$

For  $\Delta p = p(0) - p(L) = 0$

Then

$$\frac{I\mu_o H_o}{Lw} = -\rho g \quad (d)$$

For the external circuit shown,

$$V = -IR + V_o \quad (e)$$

Solving for  $I$  we get

$$I = \frac{\frac{V_o}{d} + v\mu_o H_o}{\frac{1}{\sigma Lw} + \frac{R}{d}} = \frac{-\rho g Lw}{\mu_o H_o} \quad (f)$$

Solving for the velocity,  $v$ , we get

$$v = \frac{-\frac{\rho g Lw}{\mu_o H_o} \left( \frac{1}{\sigma Lw} + \frac{R}{d} \right) - \frac{V_o}{d}}{\mu_o H_o} \quad (g)$$

For  $v > 0$ , then

$$V_o < \frac{-\rho g}{\mu_o H_o} \left( \frac{d}{\sigma} + RLw \right) \quad (h)$$

Part b

If the product  $V_o I > 0$ , then we are supplying electrical power to the fluid. From part (a), (f) and (h),  $V_o$  is always negative, but so is  $I$ . So the product  $V_o I$  is positive.

ELECTROMECHANICS OF INCOMPRESSIBLE, INVISCID FLUIDS

PROBLEM 12.23

Since the electrodes are short-circuited,

$$\bar{J} = \bar{i}_z \frac{I}{\ell d} = \sigma v B_o \bar{i}_z \quad (a)$$

In the upper reservoir

$$p_1 = p_o + \rho g(h_1 - y) \quad (b)$$

while in the lower reservoir

$$p_2 = p_o + \rho g(h_2 - y) \quad (c)$$

The pressure drop within the MHD system is

$$\Delta p = p(0) - p(\ell) = \frac{IB}{d} \quad (d)$$

Integrating along the closed contour from  $y=h_1$  through the duct to  $y=h_2$ , and then back to  $y=h_1$  we obtain

$$\oint_C \nabla p \cdot d\ell = 0 = -\rho g(h_1 - h_2) + \frac{IB}{d} \ell \quad (e)$$

Thus

$$I = \frac{\rho g(h_1 - h_2)d}{B\ell} \quad (f)$$

and so

$$v = \frac{I}{\sigma \ell d B_o} = \frac{\rho g(h_1 - h_2)}{\sigma \ell^2 B_o} \quad (g)$$

PROBLEM 12.24

Part a

We define the velocity  $v_h$  as the velocity of the fluid at the top interface, where

$$v_h = -\frac{dh}{dt} \quad (a)$$

Since  $\nabla \cdot v = 0$ , we have

$$v_h A = v_e w D \quad (b)$$

where  $v_e$  is the velocity of flow through the MHD generator (assumed constant). We assume that accelerations of the fluid are negligible. When we obtain the solution, we must check that these approximations are reasonable. With these approximations, the pressure in the storage tank is

$$p = -\rho g(y-h) + p_o \quad (c)$$

where  $p_o$  is the atmospheric pressure and  $y$  the vertical coordinate. The pressure drop in the MHD generator is

$$\Delta p = \frac{I \mu_o H_o}{D} \quad (d)$$

where  $I$  is defined positive flowing from right to left within the generator in the end view of Fig. 12P.24.

ELECTROMECHANICS OF INCOMPRESSIBLE, INVISCID FLUIDS

PROBLEM 12.24 (continued)

We have also assumed that within the generator,  $v_e$  does not vary with position. The current within the generator is

$$\frac{I}{L_o D} = \sigma \left( -\frac{IR}{w} + v_e \mu_o H_o \right) \quad (e)$$

Solving for I, we obtain

$$I = \frac{v_e \mu_o H_o}{\frac{1}{\sigma L_o D} + \frac{R}{w}} \quad (f)$$

Now, since  $\oint \nabla p \cdot d\ell = 0$ , we have

$$\Delta p - \rho gh = 0 \quad (g)$$

Thus, using (d), (f) and (g), we obtain

$$-\rho gh + \frac{(\mu_o H_o)^2}{D} \left[ \frac{1}{\frac{R}{w} + \frac{1}{\sigma L_o D}} \right] v_e = 0 \quad (h)$$

Using (b), we finally obtain

$$\frac{dh}{dt} + sh = 0 \quad (i)$$

where

$$s = \frac{\rho g w}{(\mu_o H_o)^2} \frac{D}{A} \left[ \frac{RD}{w} + \frac{1}{\sigma L_o} \right]$$

Thus  $h = 10 e^{-st}$ , until time  $\tau$ , when the valve closes at  $h = 5$ . (j)

Numerically

$$s = 7.1 \times 10^{-3}, \text{ thus } \tau \approx 100 \text{ seconds.}$$

For our approximations to be valid, we must have

$$\left| \rho \frac{\partial v_h}{\partial t} \right| \ll \rho g \quad (k)$$

or

$$s^2 h \ll g.$$

Also, we must have

$$\left| \frac{1}{2} \rho v_h^2 \right| \ll \left| \rho gh \right|$$

or

$$\frac{1}{2} s^2 h \ll g \quad (l)$$

Our other approximation was

$$\left| \rho L_o \frac{\partial v_e}{\partial t} \right| \ll \left| \frac{I \mu_o H_o}{D} \right| \quad (m)$$

which implies from (f) that

ELECTROMECHANICS OF INCOMPRESSIBLE, INVISCID FLUIDS

PROBLEM 12.24 (continued)

$$\rho s L_o \ll \frac{(\mu_o H_o)^2}{D \left[ \frac{R}{w} + \frac{1}{\sigma L_o D} \right]} \quad (n)$$

Substituting numerical values, we see that our approximations are all reasonable.

Part b

From (b) and (f)

$$I = \frac{\mu_o H_o A}{w d \left[ \frac{1}{\sigma L_o D} + \frac{R}{w} \right]} \frac{\partial h}{\partial t}$$

$$= - 650 \times 10^3 e^{-st} \text{ amperes.}$$

until  $t = 100$  seconds, where  $I = -325 \times 10^3$  amperes. Once the valve is closed,  $I = 0$ .

ELECTROMECHANICS OF INCOMPRESSIBLE, INVISCID FLUIDS

PROBLEM 12.25

Part a

Within the MHD system

$$\bar{J} = \frac{-i}{L_1 D} \bar{i}_3 = -\sigma \left( \frac{V}{w} - v \mu_o H_o \right) \bar{i}_3 \quad \text{where } V = -iR + V_o \quad (a)$$

and 
$$\Delta p = p(0) - p(-L_1) = \frac{i \mu_o H_o}{D} \quad (b)$$

We are considering static conditions ( $v=0$ ) so the pressure in tank 1 is

$$p_1 = -\rho g(x_2 - h_1) + p_o \quad (c)$$

and in tank 2 is

$$p_2 = -\rho g(x_2 - h_2) + p_o \quad (d)$$

where  $p_o$  is the atmospheric pressure,

thus

$$i = \frac{V_o}{w \left[ \frac{1}{\sigma L_1 D} + \frac{R}{w} \right]} \quad (e)$$

Now since  $\oint_C \nabla p \cdot d\mathbf{l} = 0$ , we must have

$$+ \rho g h_1 + \frac{i \mu_o H_o}{D} - \rho g h_2 = 0 \quad (f)$$

Solving in terms of  $V_o$  we obtain

$$V_o = \frac{\rho g (h_2 - h_1) w D}{(\mu_o H_o)} \left( \frac{1}{\sigma L_1 D} + \frac{R}{w} \right) \quad (g)$$

For  $h_2 = .5$  and  $h_1 = .4$  and substituting for the given values of the parameters,

we obtain

$$V_o = 6.3 \text{ millivolts}$$

Under these static conditions, the current delivered is

$$i = \frac{\rho g (h_2 - h_1) D}{\mu_o H_o} = 210 \text{ amperes}$$

and the power delivered is

$$P_e = V_o i = \left[ \frac{\rho g (h_2 - h_1) D}{\mu_o H_o} \right]^2 w \left[ \frac{1}{\sigma L_1 D} + \frac{R}{w} \right] = 1.33 \text{ watts}$$

Part b

We expand  $h_1$  and  $h_2$  around their equilibrium values  $h_{10}$  and  $h_{20}$  to obtain

$$h_1 = h_{10} + \Delta h_1$$

$$h_2 = h_{20} + \Delta h_2$$

## PROBLEM 12.25 (Continued)

Since the total volume of the fluid remains constant

$$\Delta h_2 = -\Delta h_1$$

Since we are neglecting the acceleration in the storage tanks, we may still write

$$p_1 = -\rho g(x_2 - h_1) + p_0 \quad (h)$$

$$p_2 = -\rho g(x_2 - h_2) + p_0$$

Within the MHD section, the force equation is

$$\rho \frac{\partial v}{\partial t} = -\nabla p_{\text{MHD}} + \frac{i\mu_0 H_0}{L_1 D} \quad (i)$$

Integrating with respect to  $x_1$ , we obtain

$$\Delta p_{\text{MHD}} = p(0) - p(-L) = \frac{i\mu_0 H_0}{L_1 D} - \rho L_1 \frac{\partial v}{\partial t} \quad (j)$$

The pressure drop over the rest of the pipe is

$$\Delta p_{\text{pipe}} = -L_2 \rho \frac{dv}{dt}$$

Again, since  $\oint_C \nabla p \cdot d\ell = 0$ , we have

$$\rho g(h_1 - h_2) + \Delta p_{\text{MHD}} + \Delta p_{\text{pipe}} = 0 \quad (k)$$

For  $t > 0$  we have

$$i = \frac{\frac{2V_0}{w} - v\mu_0 H_0}{\frac{1}{\sigma L_1 D} + \frac{R}{w}} \quad (l)$$

and substituting into the above equation, we obtain

$$\rho g(h_1 - h_2) - \rho(L_1 + L_2) \frac{\partial v}{\partial t} + \left( \frac{\frac{2V_0}{w} - v\mu_0 H_0}{\left[ \frac{1}{\sigma L_1 D} + \frac{R}{w} \right]} \right) \frac{\mu_0 H_0}{D} = 0 \quad (m)$$

We desire an equation just in  $\Delta h_2$ . From the  $\nabla \cdot v = 0$ , we obtain

$$vwD = \frac{d\Delta h_2}{dt} A \quad (n)$$

Making these substitutions, the resultant equation of motion is

$$\begin{aligned} \frac{d^2 \Delta h_2}{dt^2} + \frac{(\mu_0 H_0)^2}{\rho(L_1 + L_2)D \left[ \frac{1}{\sigma L_1 D} + \frac{R}{w} \right]} \frac{d\Delta h_2}{dt} + \frac{2gwd\Delta h_2}{(L_1 + L_2)A} \\ = \frac{V_0 \mu_0 H_0}{\rho(L_1 + L_2)A \left[ \frac{1}{\sigma L_1 D} + \frac{R}{w} \right]} \end{aligned} \quad (o)$$

ELECTROMECHANICS OF INCOMPRESSIBLE, INVISCID FLUIDS

PROBLEM 12.25 (continued)

Solving, we obtain

$$\Delta h_2 = \frac{V_o \mu_o H_o}{2\rho g w D \left( \frac{1}{\sigma L_1 D} + \frac{R}{w} \right)} + B_1 e^{s_1 t} + B_2 e^{s_2 t} \quad (p)$$

where  $B_1$  and  $B_2$  are arbitrary constants to be determined by initial conditions and

$$s_{1,2} = - \frac{[(\mu_o H_o)^2]}{2\rho(L_1 + L_2)D \left( \frac{1}{\sigma L_1 D} + \frac{R}{w} \right)} \pm \sqrt{\left( \frac{[(\mu_o H_o)^2]}{2\rho(L_1 + L_2)D \left( \frac{1}{\sigma L_1 D} + \frac{R}{w} \right)} \right)^2 - \frac{2g w D}{(L_1 + L_2)A}} \quad (q)$$

Substituting values, we obtain approximately

$$s_1 = - .025 \text{ sec.}^{-1}$$

$$s_2 = - .94 \text{ sec.}^{-1}$$

The initial conditions are

$$\Delta h_2(t=0) = 0$$

and

$$\frac{d\Delta h_2}{dt}(t=0) = 0$$

Thus, solving for  $B_1$  and  $B_2$  we have

$$B_1 = \frac{- V_o \mu_o H_o}{2\rho g w D \left[ \frac{1}{\sigma L_1 D} + \frac{R}{w} \right] \left( 1 - \frac{s_1}{s_2} \right)} = - .051 \quad (r)$$

$$B_2 = \frac{- V_o \mu_o H_o}{2\rho g w D \left[ \frac{1}{\sigma L_1 D} + \frac{R}{w} \right] \left( 1 - \frac{s_2}{s_1} \right)} = + 1.36 \times 10^{-3}$$

Thus

$$h_2(t) = h_{20} + \Delta h_2(t) = .55 + 1.36 \times 10^{-3} e^{-.94t} - .051 e^{-.025t} \quad (s)$$

From (l) we have

$$i = \frac{\frac{2V_o}{w} - v\mu_o H_o}{\frac{R}{w} + \frac{1}{\sigma L_1 D}} \quad (t)$$

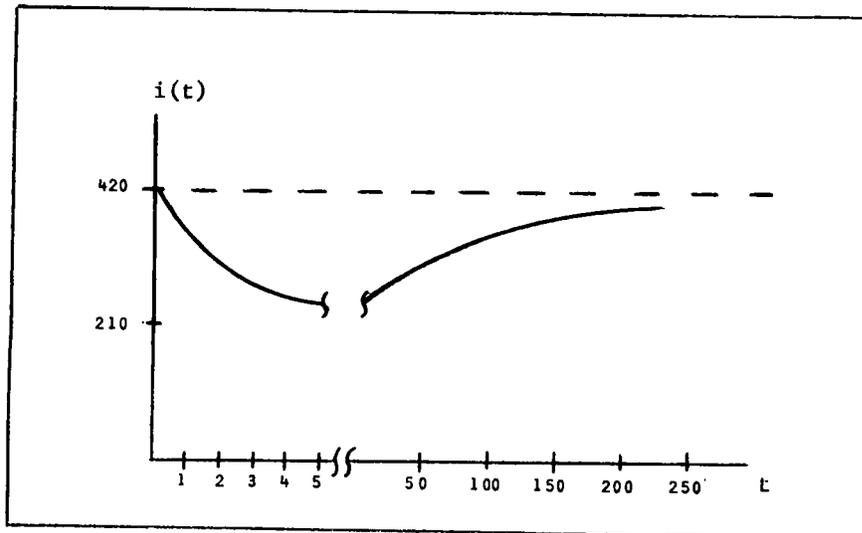

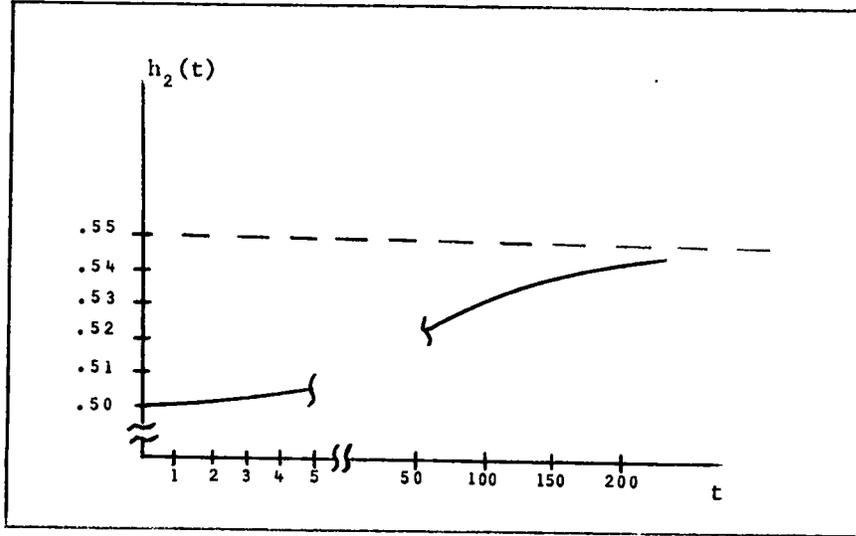

Substituting numerical values, we obtain

$$i = 420 - 2.08 \times 10^5 (B_1 s_1 e^{s_1 t} + B_2 s_2 e^{s_2 t})$$

$$= 420 - 268 (e^{-.025t} - e^{-.94t}) \quad (u)$$

ELECTROMECHANICS OF INCOMPRESSIBLE, INVISCID FLUIDS

PROBLEM 12.25 (continued)

ELECTROMECHANICS OF INCOMPRESSIBLE, INVISCID FLUIDS

PROBLEM 12.25 (continued)

Our approximations were made in (h) and (k). For them to be valid, the following relations must hold:

$$\frac{\partial^2 \Delta h_2}{g h_2} \ll 1$$

and

$$\int \frac{\partial \bar{v}}{\partial t} + (\bar{v} \cdot \nabla) \bar{v} ds \approx \frac{\partial \bar{v}}{\partial t} \sqrt{A} \ll L_2 \frac{\partial \bar{v}}{\partial t}$$

transition  
region

Substituting values, we find the first ratio to be about .001, so there our approximation is good to about .1%. In the second approximation

$$\frac{\sqrt{A}}{L_2} \approx \frac{.3}{2} \approx .15$$

Here, our approximation is good only to about 15%, which provides us with an idea of the error inherent in the approximation.

PROBLEM 12.26

Part a

We use the same coordinate system as defined in Fig. 12P.25. The magnetic field through the pump is

$$\bar{B} = \frac{N i \mu_0}{d} \bar{i}_2 \quad (a)$$

We integrate Newton's law across the length  $\ell$  to obtain

$$\begin{aligned} \rho \ell \frac{\partial v}{\partial t} &= p(0) - p(\ell) + J B \ell = -\frac{\Delta p_0}{v_0} v + \frac{i}{d} B \\ &= -\frac{\Delta p_0}{v_0} v + \frac{N \mu_0}{d^2} i^2 \end{aligned} \quad (b)$$

Thus

$$\frac{\partial v}{\partial t} + \frac{\Delta p_0}{\rho \ell v_0} v = \frac{N \mu_0}{d^2 \rho \ell} I^2 \sin^2 \omega t = \frac{N \mu_0}{2 d^2 \rho \ell} I^2 (1 - \cos 2 \omega t) \quad (c)$$

Solving, we obtain

$$v = \frac{N \mu_0 I^2}{2 d^2 \rho \ell} \left[ \frac{v_0 \rho \ell}{\Delta p_0} - \frac{\left( \frac{\Delta p_0}{\rho \ell v_0} \cos 2 \omega t + 2 \omega \sin 2 \omega t \right)}{\left( \frac{\Delta p_0}{\rho \ell v_0} \right)^2 + 4 \omega^2} \right] \quad (d)$$

Part b

The ratio R of ac to dc velocity components is:

$$R = \frac{\Delta p_0 / v_0 \rho \ell}{\left[ \left( \frac{\Delta p_0}{v_0 \rho \ell} \right)^2 + 4 \omega^2 \right]^{1/2}} \quad (e)$$

PROBLEM 12.27

Part a

The magnetic field in generator (1) is upward, with magnitude

$$B_1 = \frac{N i_1 \mu_0}{a} - \frac{N i_2 \mu_0}{a} \quad (a)$$

and in generator (2) upward with magnitude

$$B_2 = \frac{N i_1 \mu_0}{a} + \frac{N i_2 \mu_0}{a} \quad (b)$$

We define the voltages  $V_1$  and  $V_2$  across the terminals of the generators.

Applying Kirchoff's voltage law around the loops of wire with currents  $i_1$  and  $i_2$  we have

$$V_1 + N \frac{d\lambda_1}{dt} + N_m \frac{d\lambda_2}{dt} + i_1 R_L = 0 \quad (c)$$

and

$$V_2 + N \frac{d\lambda_2}{dt} - N_m \frac{d\lambda_1}{dt} + i_2 R_L = 0 \quad (d)$$

where

$$\lambda_1 = B_1 w b \quad (e)$$

$$\lambda_2 = B_2 w b$$

From conservation of current we have

$$\frac{i_1}{ab\sigma} = \frac{V_1}{w} + VB_1 \quad (f)$$

and

$$\frac{i_2}{ab\sigma} = \frac{V_2}{w} + VB_2 \quad (g)$$

Combining these relations, we obtain

$$(N^2 + N_m^2) \frac{wb\mu_0}{a} \frac{di_1}{dt} + i_1 \left[ \frac{w}{ab\sigma} + R_L - \frac{w\mu_0 NV}{a} \right] + \frac{\mu_0 w}{a} VN_m i_2 = 0 \quad (h)$$

and

$$(N^2 + N_m^2) \frac{wb\mu_0}{a} \frac{di_2}{dt} + i_2 \left[ \frac{w}{ab\sigma} + R_L - \frac{VN\mu_0 w}{a} \right] - \frac{N_m\mu_0}{a} wVi_1 = 0 \quad (i)$$

Part b

We combine these two first-order differential equations to obtain one second-order equation.

$$a_1 \frac{d^2 i_2}{dt^2} + a_2 \frac{di_2}{dt} + a_3 i_2 = 0 \quad (j)$$

where

$$a_1 = \frac{\left[ (N^2 + N_m^2) \frac{wb\mu_0}{a} \right]^2}{wN_m V\mu_0 a} \quad (k)$$

PROBLEM 12.27 (continued)

$$a_2 = 2 \left[ \frac{w}{ab\sigma} + R_L - \frac{w\mu_o NV}{a} \right] \left[ \frac{(N^2 + N_m^2)b}{N_m V} \right]$$

$$a_3 = \frac{VN_m \mu_o w}{a}$$

If we assume solutions of the form

$$i_2 = Ae^{st} \tag{l}$$

Then we must have

$$a_1 s^2 + a_2 s + a_3 = 0 \tag{m}$$

or

$$s = \frac{-a_2 \pm \sqrt{a_2^2 - 4a_1 a_3}}{2a_1}$$

For the generators to be stable, the real part of  $s$  must be negative.

Thus

$$a_2 > 0 \text{ for stability}$$

which implies the condition for stability is

Part c  $\frac{w}{ab\sigma} + R_L > \frac{w\mu_o NV}{a}$  (n)

When  $a_2 = 0$

$$\frac{w}{ab\sigma} + R_L = \frac{w\mu_o NV}{a} \tag{o}$$

then  $s$  is purely imaginary, so the system will operate in the sinusoidal steady state.

Then

$$s = \pm j \sqrt{\frac{a_3}{a_1}}$$

$$= \pm j \frac{N_m V}{b(N^2 + N_m^2)} \tag{p}$$

The length  $b$  necessary for sinusoidal operation is

$$b = \frac{w}{a\sigma \left[ \frac{w\mu_o NV}{a} - R_L \right]} \tag{q}$$

Substituting values, we obtain

$$b = 4 \text{ meters.}$$

Part d

Thus, the frequency of operation is

$$\omega = \frac{4000}{8} = 500 \text{ rad/sec.}$$

or

$$f = \frac{\omega}{2\pi} \approx 80 \text{ Hz.}$$

PROBLEM 12.28
Part a

The magnetic field within the generator is

$$\vec{B} = \frac{\mu_0 N i}{w} \vec{i}_2 \quad (a)$$

The current through the generator is

$$\vec{J} = \vec{i}_1, \frac{i}{\ell w} = \sigma \left( \frac{v}{D} + vB \right) \vec{i}_1, \quad (b)$$

Solving for  $v$ , the voltage across the channel, we obtain

$$v = \left( \frac{D}{\sigma \ell w} - \frac{v \mu_0 N}{w} D \right) i \quad (c)$$

We apply Faraday's law around the electrical circuit to obtain

$$v + \frac{1}{C} \int i dt + i R_L = - \frac{\mu_0 N^2}{w} \ell d \frac{di}{dt} \quad (d)$$

Differentiating and simplifying this equation we finally obtain

$$\frac{d^2 i}{dt^2} + \left( \frac{R_L w}{\mu_0 N^2 \ell d} + \frac{D}{\sigma L w} - \frac{\mu_0 N D v}{w} \right) \frac{di}{dt} + \frac{w}{\mu_0 N^2 \ell d C} i = 0 \quad (e)$$

We assume that  $i = \text{Re } \hat{I} e^{st}$ .

Substituting this assumed solution back into the differential equation, we obtain

$$s^2 + \left( \frac{R_L w}{\mu_0 N^2 \ell d} + \frac{D}{\sigma L w} - \frac{\mu_0 N D v}{w} \right) s + \frac{w}{\mu_0 N^2 \ell d C} = 0 \quad (f)$$

Solving, we have

$$s = - \frac{\left( \frac{R_L w}{\mu_0 N^2 \ell d} + \frac{D}{\sigma L w} - \frac{\mu_0 N D v}{w} \right)}{2} \pm \sqrt{\frac{\left( \frac{R_L w}{\mu_0 N^2 \ell d} + \frac{D}{\sigma L w} - \frac{\mu_0 N D v}{w} \right)^2}{4} - \frac{w}{\mu_0 N^2 \ell d C}} \quad (g)$$

For the device to be a pure ac generator, we must have that  $s$  is purely imaginary, or

$$R_L = \left( \frac{\mu_0 N D v}{w} - \frac{D}{\sigma L w} \right) \frac{\mu_0 N^2 \ell d}{w} \quad (h)$$

Part b

The frequency of operation is then

$$\omega = \frac{w}{\mu_0 N^2 \ell d C} \quad (i)$$

PROBLEM 12.29
Part a

The current within the MHD generator is

$$\vec{J} = \frac{i}{\ell d} \vec{i}_y = \sigma \left( \frac{v}{w} + v B_0 \right) \vec{i}_y \quad (a)$$

ELECTROMECHANICS OF INCOMPRESSIBLE, INVISCID FLUIDS

PROBLEM 12.29 (continued)

where  $V$  is the voltage across the channel. The pressure drop along the channel is

$$\Delta p = p_1 - p_0 = \frac{iB_0}{d} + \rho \frac{\partial v}{\partial t} \ell \quad (b)$$

where we assume that  $v$  does not vary with distance along the channel. With the switch open, we apply Faraday's law around the circuit, for which we obtain

$$V + 2iR = 0 \quad (c)$$

Since the pressure drop is maintained constant, we solve for  $v$  to obtain

$$\left( \frac{2\sigma R}{w} + \frac{1}{\ell d} \right) \frac{\rho \ell d}{B_0} \frac{\partial v}{\partial t} + \sigma v B_0 = \left( \frac{1}{\ell d} + \frac{2\sigma R}{w} \right) \frac{d}{B_0} \Delta p \quad (d)$$

In the steady state

$$v = \left( \frac{1}{\sigma \ell d} + \frac{2R}{w} \right) \frac{d}{B_0^2} \Delta p \quad (e)$$

and

$$i = \frac{d}{B_0} \Delta p \quad (f)$$

Part b

For  $t > 0$ , the differential equation for  $v$  is

$$\left( \frac{\sigma R}{w} + \frac{1}{\ell d} \right) \frac{\rho \ell d}{B_0} \frac{\partial v}{\partial t} + \sigma v B_0 = \left( \frac{1}{\ell d} + \frac{\sigma R}{w} \right) \frac{d}{B_0} \Delta p \quad (g)$$

The general solution for  $v$  is

$$v = \left( \frac{1}{\sigma \ell d} + \frac{R}{w} \right) \frac{d}{B_0^2} \Delta p + A e^{-t/\tau} \quad (h)$$

where  $\tau = \left( \frac{\sigma R}{w} + \frac{1}{\ell d} \right) \frac{\ell d}{\sigma B_0^2}$

We evaluate  $A$  by realizing that at  $t = 0$ , the velocity must be continuous.

Therefore

$$v = \left( \frac{1}{\sigma \ell d} + \frac{R}{w} \right) \frac{d}{B_0^2} \Delta p + \frac{R}{w} \frac{d}{B_0^2} \Delta p e^{-t/\tau} \quad (i)$$

and

$$\begin{aligned} i &= \Delta p \left( 1 + \frac{\rho \ell}{\tau} \frac{R}{w} \frac{d}{B_0^2} e^{-t/\tau} \right) \frac{d}{B_0} \\ &= \Delta p \left( 1 + \frac{R\sigma e^{-t/\tau}}{w \left[ \frac{\sigma R}{w} + \frac{1}{\ell d} \right]} \right) \frac{d}{B_0} \end{aligned} \quad (j)$$

PROBLEM 12.30

Part a

The magnetic field in the generator is

$$B = \frac{\mu_0 Ni}{d} \quad (a)$$

The current within the generator is

$$\frac{i}{\ell d} = \sigma \left( \frac{V}{w} + vB \right) \quad (b)$$

PROBLEM 12.30 (continued)

where  $V$  is the voltage across the channel. The pressure drop in the channel is

$$\Delta p = p_i - p_o = \Delta p_o \left(1 - \frac{v}{v_o}\right) = \frac{iB}{d} \quad (c)$$

Applying Faraday's law around the external circuit, we obtain

$$V + i(R_L + R_C) = - \frac{d(NB\ell w)}{dt} = - \frac{\ell w}{d} \mu_o N^2 \frac{di}{dt} \quad (d)$$

Using (a), (b), (c) and (d), the differential equation for  $i$  is then

$$\frac{\ell \mu_o N^2}{d} \frac{di}{dt} + i \left[ \frac{R_L + R_C}{w} + \frac{1}{\sigma \ell d} - \frac{\mu_o N}{d} v_o \right] + \frac{\left(\frac{\mu_o N}{d}\right)^2}{d \Delta p_o} v_o i^3 = 0 \quad (e)$$

In the steady state, we have

$$i^2 = - \frac{\left[ \frac{R_L + R_C}{w} + \frac{1}{\sigma \ell d} - \frac{\mu_o N v_o}{d} \right] d \Delta p_o}{\left[ \frac{\mu_o N}{d} \right]^2 v_o} \quad (f)$$

The power dissipated in  $R_L$  is

$$P = i^2 R_L$$

For  $P = 1.5 \times 10^6$ , then

$$i^2 = .6 \times 10^8 \text{ (amperes)}^2$$

Substituting in values for the parameters in (f), we obtain

$$i^2 = .6 \times 10^8 = - \frac{(.125 + 2.5 \times 10^{-6} N^2 - 6.3 \times 10^{-4} N) 40 \times 10^3}{N^2 (4 \times 10^{-8})} \quad (g)$$

Rearranging (g), we obtain

$$N^2 - 102N + 2.04 \times 10^3 = 0$$

or  $N = 75, 27$

The most efficient solution is that one which dissipates the least power in the coil's resistance. Thus, we choose

$$N = 27$$

Part b

Substituting numerical values into (e), using  $N = 27$ , we obtain

$$(1.27 \times 10^7) \frac{di}{dt} - (6 \times 10^7) i + i^3 = 0 \quad (h)$$

or, rewriting, we have

$$\frac{dt}{1.27 \times 10^7} = \frac{di}{i(6 \times 10^7 - i^2)} \quad (i)$$

Integrating, we obtain

$$9.4t + C = \log \left( \frac{i^2}{6 \times 10^7 - i^2} \right) \quad (j)$$

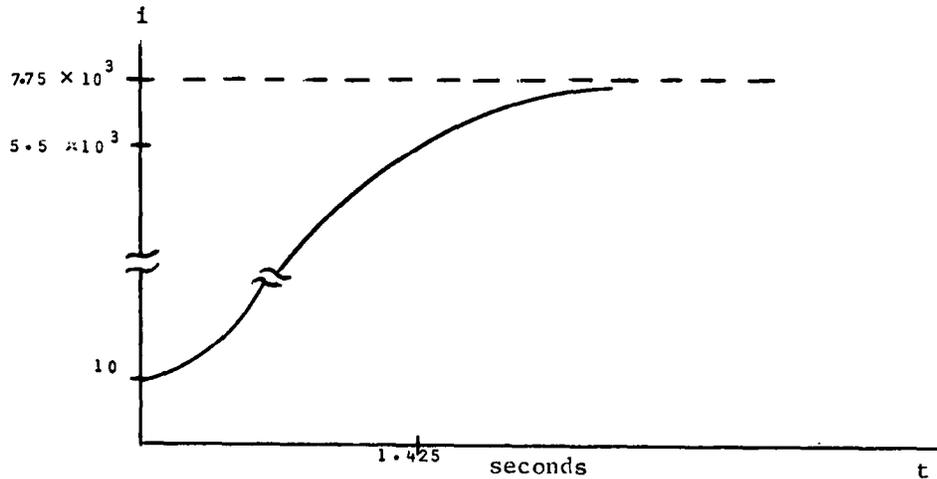

We evaluate the arbitrary constant  $C$  by realizing that at  $t=0$ ,  $i = 10$  amps

PROBLEM 12.30 (continued)

Thus  $C = -13.3$

We take the anti-log of both sides of (j), and solve for  $i^2$  to obtain

$$i^2 = \frac{6 \times 10^7}{1 + e^{(13.3 - 9.4t)}} \quad (k)$$

Part c

For  $N = 27$ , in the steady state, we use (f) to write

$$P = i^2 R_L = \frac{- \left[ \frac{R_L + R_C}{w} + \frac{1}{\sigma l d} - \frac{\mu_o N v_o}{d} \right] d \Delta p_o R_L}{\left( \frac{\mu_o N}{d} \right)^2 v_o}$$

or

$$P = a_1 R_L - a_2 R_L^2$$

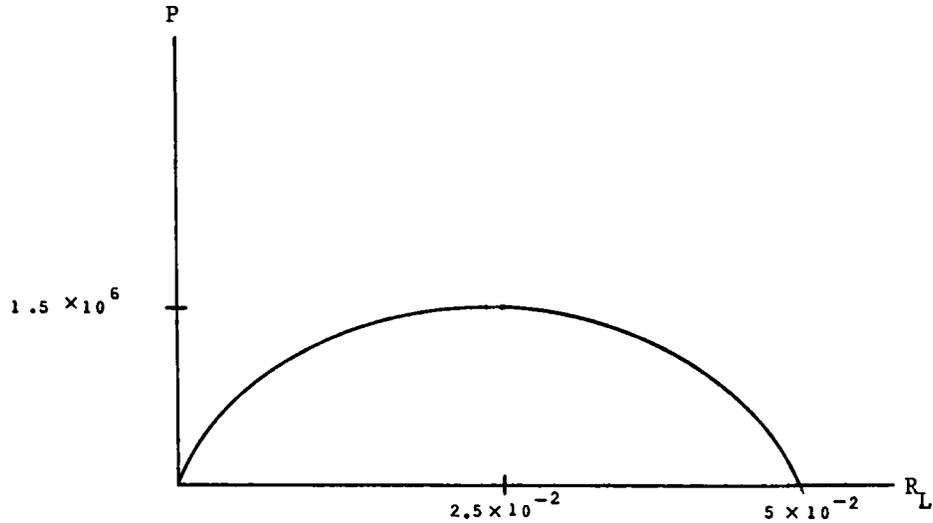

where

$$a_1 = - \frac{d \Delta p_o \left( \frac{R_C}{w} + \frac{1}{\sigma l d} - \frac{\mu_o N v_o}{d} \right)}{\left( \frac{\mu_o N}{d} \right)^2 v_o} \approx 1.47 \times 10^8$$

and

$$a_2 = \frac{d \Delta p_o}{\left( \frac{\mu_o N}{d} \right)^2 v_o} \approx \frac{1}{2.85 \times 10^{-10}}$$

PROBLEM 12.30 (continued)

PROBLEM 12.31

Part a

With the switch open, the current through the generator is

$$\bar{J} = 0 = \frac{i}{\ell d} \bar{i}_y = \sigma \left( -\frac{V}{w} + v B_o \right) \bar{i}_y \quad (a)$$

where  $V$  is the voltage across the channel. In the steady state, the pressure drop in the channel is

$$\Delta p = p_i - p_o = \frac{iB}{d} = 0 = \Delta p_o \left( 1 - \frac{v}{v_o} \right) \quad (b)$$

Thus,  $v = v_o$  and the voltage across the channel is

$$V = v_o B_o w. \quad (c)$$

Part b

With the switch closed, applying Faraday's law around the circuit we obtain

$$V = i R_L \quad (d)$$

Thus

$$\frac{i}{\ell d} = -\frac{\sigma R_L}{w} i + \sigma v B_o \quad (e)$$

and

$$\Delta p = \frac{iB}{d} + \rho \frac{\partial v}{\partial t} \ell = \Delta p_o \left( 1 - \frac{v}{v_o} \right) \quad (f)$$

Obtaining an equation in  $v$ , we have

$$\rho \ell \frac{\partial v}{\partial t} + v \left[ \frac{\Delta p_o}{v_o} + \frac{\sigma B_o}{\frac{1}{\ell d} + \frac{\sigma R_L}{w}} \right] = \Delta p_o \quad (g)$$

ELECTROMECHANICS OF INCOMPRESSIBLE, INVISCID FLUIDS

PROBLEM 12.31 (continued)

Solving for  $v$  we obtain

$$v = Ae^{-t/\tau} + \frac{\Delta p_o}{\left(\frac{\Delta p_o}{v_o} + \frac{B_o w}{R_L + R_i}\right)} \quad \text{where } R_i = \frac{w}{\sigma l d} \quad (h)$$

and where

$$\tau = \frac{\rho l}{\left[\frac{\Delta p_o}{v_o} + \frac{w B_o}{R_L + R_i}\right]} \quad (i)$$

at  $t = 0$ , the velocity must be continuous. Therefore,

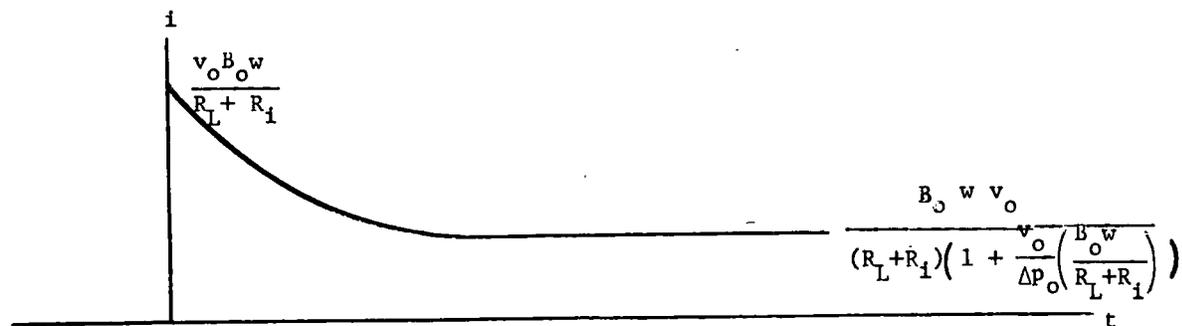

$$A = v_o - \frac{\Delta p_o}{\left(\frac{\Delta p_o}{v_o} + \frac{w B_o}{R_L + R_i}\right)}$$

Now, the current is

$$i = \frac{w B_o v}{R_L + R_i} \quad (k)$$

Thus

$$i = \left(\frac{w B_o}{R_L + R_i}\right) \left[ \frac{\Delta p_o}{\left(\frac{\Delta p_o}{v_o} + \frac{w B_o}{R_L + R_i}\right)} (1 - e^{-t/\tau}) + v_o e^{-t/\tau} \right] \quad (l)$$

PROBLEM 12.32

The current in the generator is

$$\frac{i}{\ell_1 d} = \sigma \left( \frac{V}{w} - vB \right) \quad (a)$$

where we assume that the  $\bar{B}$  field is up and that the fluid flows counter-clockwise.

We integrate Newton's law around the channel to obtain

$$\rho \ell \frac{\partial v}{\partial t} = J B \ell_1 = \frac{i}{d} B \quad (b)$$

or, using (a),

$$\frac{\partial V}{\partial t} = \frac{w}{d \ell_1 \sigma} \frac{\partial i}{\partial t} + \frac{B^2 w}{d \rho \ell} i \quad (c)$$

Integrating, we have

$$V = \frac{w}{d \ell_1 \sigma} i + \frac{B^2 w}{d \rho \ell} \int_0^\infty i dt \quad (d)$$

Defining  $R_i = \frac{w}{\sigma \ell_1 d}$

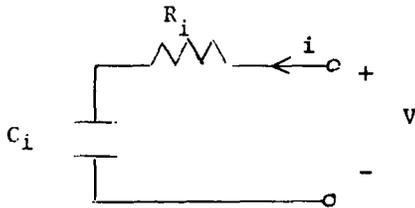

and

$$C_i = \frac{\rho \ell d}{w B^2}$$

we rewrite (d) as

$$V = i R_i + \frac{1}{C_i} \int_0^\infty i dt \quad (e)$$

The equivalent circuit implied by (e) is

PROBLEM 12.33

Part a

We assume that the capacitor is initially uncharged when the switch is closed at  $t = 0$ . The current through the capacitor is

$$i = C \frac{dV_C}{dt} = \sigma \ell d \left( -\frac{V_C}{w} + v_o B_o \right) \quad (a)$$

or

$$\frac{dV_C}{dt} + \frac{\sigma \ell d}{w C} V_C = \frac{\sigma \ell d v_o}{C} B_o \quad (b)$$

PROBLEM 12.33 (Continued)

The solution for  $V_C$  is

$$V_C = v_o B_o w (1 - e^{-t/\tau}) \quad (c)$$

with  $\tau = \frac{wC}{\sigma \ell d}$ , where we have used the initial condition that at  $t = 0$ , the voltage cannot change instantaneously across the capacitor. The energy stored as  $t \rightarrow \infty$ , is

$$W_e = \frac{1}{2} C V_C^2 = \frac{1}{2} C (v_o B_o w)^2 \quad (d)$$

Part b

The pressure drop along the fluid is

$$\Delta p = \frac{i B_o}{d} = B_o^2 v_o \sigma \ell e^{-t/\tau} \quad (e)$$

The total energy supplied by the fluid source is

$$\begin{aligned} W_f &= \int_0^{\infty} \Delta p v_o dw dt \\ &= \int_0^{\infty} (v_o B_o)^2 \sigma \ell w d e^{-t/\tau} dt \\ &= -\sigma \ell (v_o B_o)^2 \tau w d e^{-t/\tau} \Big|_0^{\infty} \end{aligned} \quad (f)$$

$$W_f = C (w v_o B_o)^2 \quad (g)$$

Part c

We see that the energy supplied by the fluid source is twice that stored in the capacitor. The rest of the energy has been dissipated by the conducting fluid. This dissipated energy is

$$\begin{aligned} W_d &= \int_0^{\infty} V_C i dt \\ &= \int_0^{\infty} + (v_o B_o)^2 w (1 - e^{-t/\tau}) \sigma \ell d e^{-t/\tau} dt \\ &= \sigma \ell d w (v_o B_o)^2 \left[ -\tau e^{-t/\tau} + \frac{\tau}{2} e^{-2t/\tau} \right] \Big|_0^{\infty} \\ &= \sigma \ell d w (v_o B_o)^2 \frac{\tau}{2} \end{aligned} \quad (i)$$

Therefore

$$W_d = \frac{1}{2} C (v_o B_o w)^2 \quad (j)$$

Thus

$$W_{\text{fluid}} = W_{\text{elec}} + W_{\text{dissipated}} \quad (k)$$

As we would expect from conservation of energy.

PROBLEM 12.34

The current through the generator is

$$\frac{i}{\ell_1 d} = \sigma \left( \frac{V}{w} - v B_o \right) \quad (a)$$

Since the fluid is incompressible, and the channel has constant cross-sectional area, the velocity of the fluid does not change with position. Thus, we write Newton's law as in Eq. (12.2.41) as

$$\rho \frac{\partial \bar{v}}{\partial t} = -\nabla(p+U) + \bar{J} \times \bar{B} \quad (b)$$

where  $U$  is the potential energy due to gravity. We integrate this expression along the length of the tube to obtain

$$\rho \frac{\partial v}{\partial t} \ell = \frac{i B_o}{d} - \rho g(x_a + x_b) \quad (c)$$

Realizing that  $x_a = x_b$

$$\text{and} \quad v = \frac{dx_a}{dt} \quad (d)$$

We finally obtain

$$\frac{d^2 x_a}{dt^2} + \frac{\sigma B_o^2 \ell_1}{\rho \ell} \frac{dx_a}{dt} + \frac{2g}{\ell} x_a = \frac{\sigma B_o V}{w \rho} \frac{\ell_1}{\ell} \quad (e)$$

We assume the transient solution to be of the form

$$x_a = \hat{x} e^{st} \quad (f)$$

Substituting into the differential equation, we obtain

$$s^2 + \frac{\sigma B_o^2 \ell_1}{\rho \ell} s + \frac{2g}{\ell} = 0 \quad (g)$$

Solving for  $s$ , we obtain

$$s = -\frac{\sigma B_o^2 \ell_1}{2\rho \ell} \pm \sqrt{\left(\frac{\sigma B_o^2 \ell_1}{2\rho \ell}\right)^2 - \frac{2g}{\ell}} \quad (h)$$

Substituting the given numerical values, we obtain

$$\begin{aligned} s_1 &= -29.4 \\ s_2 &= -.665 \end{aligned} \quad (i)$$

In the steady state

$$x_a = \frac{\sigma B_o V \ell_1}{w \rho 2g} \approx .075 \text{ meters} \quad (j)$$

Thus the general solution is of the form

$$x_a = .075 + A_1 e^{s_1 t} + A_2 e^{s_2 t} \quad (k)$$

where the initial conditions to solve for  $A_1$  and  $A_2$  are

PROBLEM 12.34 (continued)

$$x_a(t=0) = 0$$

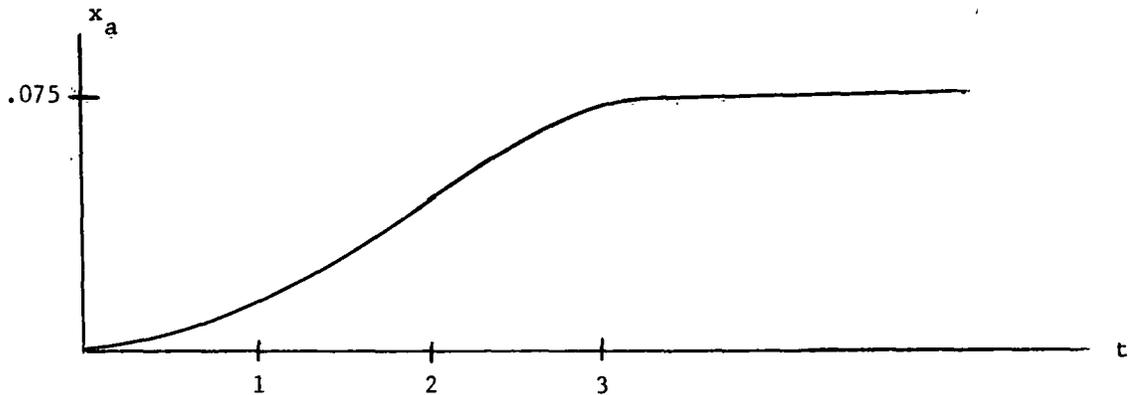

$$\frac{dx_a}{dt}(t=0) = 0$$

(l)

Thus,  $A_2 = \frac{.075 s_1}{s_2 - s_1} = -.0765$  and  $A_1 = -\frac{.075 s_2}{s_2 - s_1} = .00174$

Thus, we have:

$$x_a = .075 + .00174e^{-29.4t} - .0765e^{-.665t}$$

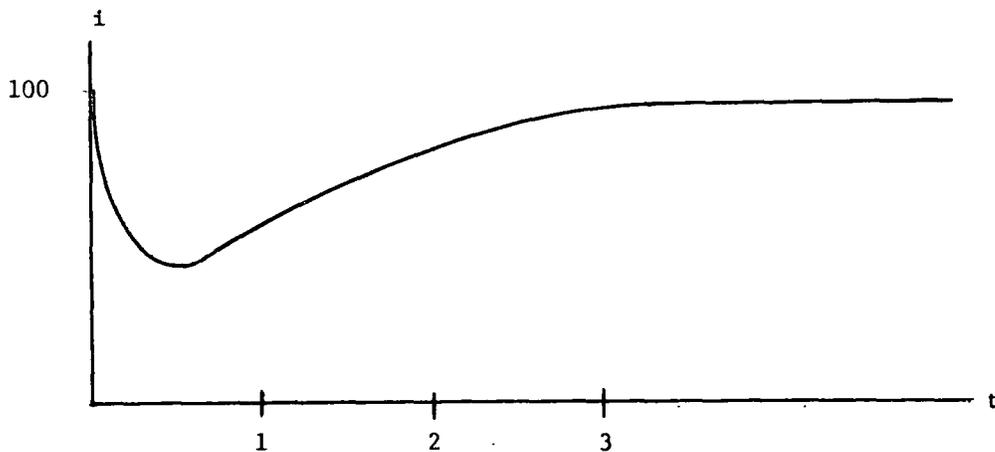

Now the current is

$$\begin{aligned} i &= \ell_1 d\sigma \left( \frac{v}{w} - B_0 \frac{dx_a}{dt} \right) \\ &= \ell_1 d\sigma \left[ \frac{v}{w} - B_0 (s_1 A_1 e^{s_1 t} + s_2 A_2 e^{s_2 t}) \right] \\ &= 100 - 2 \times 10^3 (s_1 A_1 e^{s_1 t} + s_2 A_2 e^{s_2 t}) \text{ amperes} \\ &= 100(1 + e^{-29.4t} - e^{-.665t}) \end{aligned}$$

(m)

Sketching, we have

PROBLEM 12.35

The currents  $I_1$  and  $I_2$  are determined by the resistance of the fluid between the electrodes. Thus

$$I_1 = \frac{V_o \sigma D x}{w} \quad (a)$$

and

$$I_2 = \frac{V_o \sigma D y}{w} \quad (b)$$

The magnetic field produced by the circuit is

$$\bar{B} = \frac{\mu_o N}{w} (I_2 - I_1) \bar{i}_2 \quad (c)$$

or

$$\bar{B} = \frac{\mu_o N}{w^2} V_o \sigma D (y - x) \bar{i}_2 \quad (d)$$

From conservation of mass,

$$y = (L - x) \quad (e)$$

Thus

$$\bar{B} = \frac{\mu_o N V_o \sigma D}{w^2} (L - 2x) \bar{i}_2 \quad (f)$$

The momentum equation is

$$\rho \frac{\partial \bar{v}}{\partial t} = -\nabla(p + U) + \bar{J} \times \bar{B} \quad (g)$$

Integrating the equation along the conduit's length, we obtain

$$\rho \frac{\partial v}{\partial t} (2L + 2a) = -\rho g (y - x) - J_o B L \quad (h)$$

Now

$$v = -\frac{\partial x}{\partial t} \quad (i)$$

so we write:

$$2\rho(L + a) \frac{\partial^2 x}{\partial t^2} + \left( \rho g + J_o \frac{\mu_o N V_o \sigma D L}{w^2} \right) (2x - L) = 0 \quad (j)$$

We assume solutions of the form

$$x = \text{Re } \hat{x} e^{st} + \frac{L}{2} \quad (k)$$

Thus

$$s^2 + \frac{g}{(L + a)} + \frac{\mu_o N V_o \sigma D}{\rho w^2 (L + a)} J_o L = 0 \quad (l)$$

Defining

$$\omega_o^2 = \frac{g}{(L + a)} + \frac{\mu_o N V_o \sigma D J_o L}{\rho w^2 (L + a)} \quad (m)$$

we have our solution in the form

$$x = A \sin \omega_o t + B \cos \omega_o t + \frac{L}{2} \quad (n)$$

Applying the initial conditions

$$x(0) = L \quad \text{and} \quad \frac{dx(0)}{dt} = 0 \quad (o)$$

we obtain

$$x = \frac{L}{2} (1 + \cos \omega_o t) \quad (p)$$

PROBLEM 12.36

As from Eqs. (12.2.88 - 12.2.91), we assume that

$$\begin{aligned}\bar{v} &= \bar{i}_\theta v_\theta \\ \bar{B} &= B_o \bar{i}_z + \bar{i}_\theta B_\theta \\ \bar{J} &= \bar{i}_r J_r + \bar{i}_z J_z \\ \bar{E} &= \bar{i}_r E_r + \bar{i}_z E_z\end{aligned}\tag{a}$$

As derived in Sec. 12.2.3, Eq. (12.2.102), we know that the equation governing Alfvén waves is

$$\frac{\partial^2 v_\theta}{\partial t^2} = \frac{B_o^2}{\mu_o \rho} \frac{\partial^2 v_\theta}{\partial z^2}\tag{b}$$

For our problem, the boundary conditions are:

$$\begin{aligned}\text{at } z = 0 & \quad E_r = 0 \\ \text{at } z = \ell & \quad v_\theta = \text{Re}[\Omega r e^{j\omega t}]\end{aligned}\tag{c}$$

As in section 12.2.3, we assume

$$v_\theta = \text{Re}[A(r) \hat{v}_\theta(z) e^{j\omega t}]\tag{d}$$

Thus, the pertinent differential equation reduces to

$$\frac{d^2 \hat{v}_\theta}{dz^2} + k^2 \hat{v}_\theta = 0\tag{e}$$

where  $k = \omega \sqrt{\frac{\mu_o \rho}{B_o^2}}$

The solution is

$$\hat{v}_\theta = C_1 \cos kz + C_2 \sin kz\tag{f}$$

Imposing the boundary condition at  $z = \ell$ , we obtain

$$A(r)[C_1 \cos k\ell + C_2 \sin k\ell] = \Omega r\tag{g}$$

We let

$$A(r) = \frac{r}{R}\tag{h}$$

and thus

$$\Omega R = C_1 \cos k\ell + C_2 \sin k\ell\tag{i}$$

Now

$$E_r = -v_\theta B_o\tag{j}$$

Thus, applying the second boundary condition, we obtain

$$v_\theta(z=0) = 0$$

or  $C_1 = 0\tag{k}$

Thus  $C_2 = \frac{\Omega R}{\sin k\ell}\tag{l}$

Now, using the relations

$$E_r = -v_\theta B_o\tag{m}$$

PROBLEM 12.36 (continued)

$$E_z = 0 \quad (n)$$

$$\frac{\partial E_r}{\partial z} - \frac{\partial E_z}{\partial r} = - \frac{\partial B_\theta}{\partial t} \quad (o)$$

$$- \frac{1}{\mu_o} \frac{\partial B_\theta}{\partial z} = J_r \quad (p)$$

$$\frac{1}{\mu_o r} \frac{\partial(rB_\theta)}{\partial r} = J_z \quad (q)$$

we obtain

$$v_\theta = \text{Re} \left[ \frac{\Omega r}{\sin k\ell} \sin kz e^{j\omega t} \right] \quad (r)$$

$$B_\theta = \text{Re} \left[ \frac{\Omega r B_o k}{j \omega \sin k\ell} \cos kz e^{j\omega t} \right] \quad (s)$$

$$J_r = \text{Re} \left[ \frac{\Omega r B_o k^2}{\mu_o j \omega \sin k\ell} \sin kz e^{j\omega t} \right] \quad (t)$$

$$J_z = \text{Re} \left[ \frac{2 \Omega B_o k}{\mu_o j \omega \sin k\ell} \cos kz e^{j\omega t} \right] \quad (u)$$

PROBLEM 12.37
Part a

We perform a similar analysis as in section 12.2.3, Eqs. (12.2.84 - 12.2.88).

From Maxwell's equation

$$\nabla \times \bar{E} = - \frac{\partial \bar{B}}{\partial t} \quad (a)$$

which yields

$$\frac{\partial E_y}{\partial z} = \frac{\partial}{\partial t} B_x \quad (b)$$

Now, since the fluid is perfectly conducting,

$$\bar{E}' = \bar{E} + \bar{v} \times \bar{B} = 0 \quad (c)$$

$$\text{or } E_y = v_x B_o \quad (d)$$

Substituting, we obtain

$$B_o \frac{\partial v_x}{\partial z} = \frac{\partial B_x}{\partial t} \quad (e)$$

The x component of the force equation is

$$\rho \frac{\partial v_x}{\partial t} = \frac{\partial T_{xz}}{\partial z} \quad (f)$$

where

$$T_{xz} = \frac{B_o}{\mu_o} B_x \quad (g)$$

ELECTROMECHANICS OF INCOMPRESSIBLE, INVISCID FLUIDS

PROBLEM 12.37 (continued)

Thus

$$\rho \frac{\partial v_x}{\partial t} = \frac{B_o}{\mu_o} \frac{\partial B_x}{\partial z} \quad (h)$$

Eliminating  $B_x$  and solving for  $v_x$ , we obtain

$$\frac{\partial^2 v_x}{\partial t^2} = \frac{B_o^2}{\mu_o \rho} \frac{\partial^2 v_x}{\partial z^2} \quad (i)$$

or eliminating and solving for  $H_x$ , we have

$$\frac{\partial^2 H_x}{\partial t^2} = \frac{B_o^2}{\mu_o \rho} \frac{\partial^2 H_x}{\partial z^2} \quad (j)$$

where

$$B_x = \mu_o H_x \quad (k)$$

Part b

The boundary conditions are

$$v_x(-l, t) = \text{Re } V e^{j\omega t} \quad (l)$$

$$E_y(0, t) = 0 \rightarrow v_x(0, t) = 0 \quad (m)$$

We write the solution in the form

$$v_x = A e^{j(\omega t - kz)} + B e^{j(\omega t + kz)} \quad (n)$$

where

$$k = \omega \sqrt{\frac{\mu_o \rho}{B_o^2}}$$

Applying the boundary conditions, we obtain

$$v_x(l, t) = \text{Re} \left[ -\frac{V \sin kz}{\sin kl} \right] e^{j\omega t} \quad (o)$$

Now

$$B_o \frac{\partial v_x}{\partial z} = \frac{\partial B_x}{\partial t} \quad (p)$$

or

$$\frac{-B_o V k \cos kz}{\sin kl} = j\omega \mu_o \hat{H}_x \quad (q)$$

Thus

$$H_x = \text{Re} \left[ \frac{-B_o V k \cos kz}{j\omega \mu_o \sin kl} e^{j\omega t} \right] \quad (r)$$

Part c

From Maxwell's equations

$$\nabla \times \bar{H} = \bar{i}_y \frac{\partial H_x}{\partial z} = \bar{J} \quad (s)$$

Thus

$$\bar{J} = \bar{i}_y \text{Re} \left[ \frac{B_o V k^2 \sin kz}{j\omega \mu_o \sin kl} e^{j\omega t} \right] \quad (t)$$

PROBLEM 12.37 (continued)

Since  $\nabla \cdot \bar{J} = 0$ , the current must have a return path, so the walls in the x-z plane must be perfectly conducting.

Even though the fluid has no viscosity, since it is perfectly conducting, it interacts with the magnetic field such that for any motion of the fluid, currents are induced such that the magnetic force tends to restore the fluid to its original position. This shearing motion sets the neighboring fluid elements into motion, whereupon this process continues throughout the fluid.
